

Econophysics Colloquium, Erice, Oct. 26-30, 2009

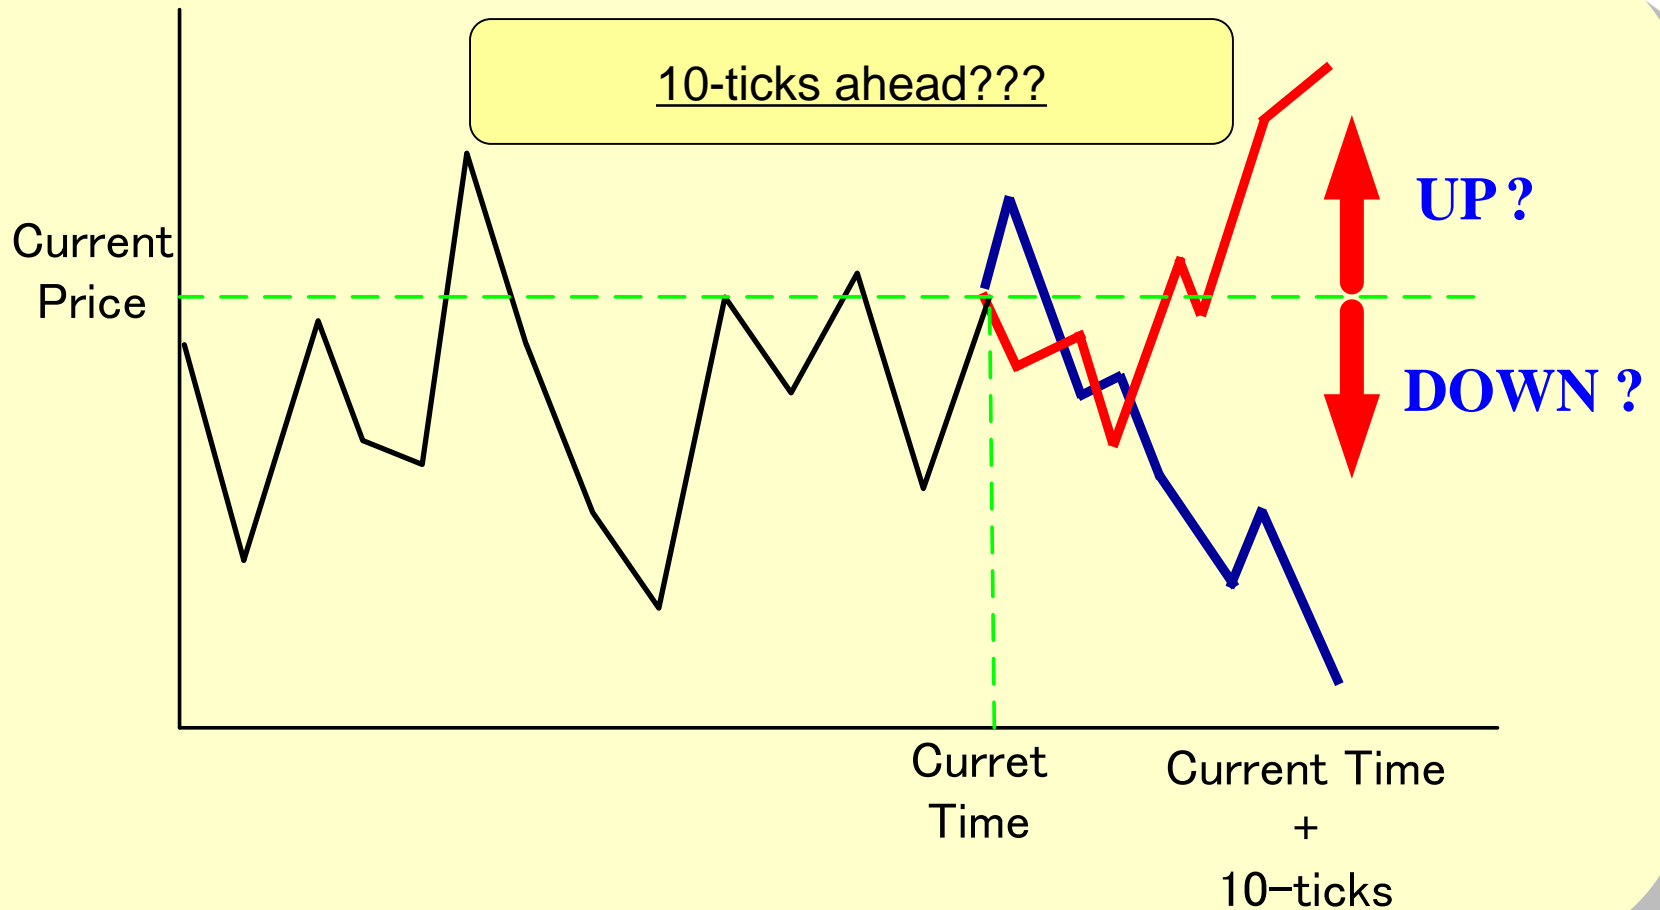

Application of Evolutional Computation, and Other Techniques to Understand the Intra-day Financial Prices

Mieko TANAKA-YAMAWAKI

and her students in Tottori University

mieko@ike.tottori-u.ac.jp

Tick Price Changes may be Predictable?

Objectives

- Forecasting Tick-wise Price
- Evolutional Strategy
- Improving the Forecast by Recognizing Two Stochastic Phases
- Labeling Different Phases by Means of Technical Indicators
- Constructing a Prediction Generator

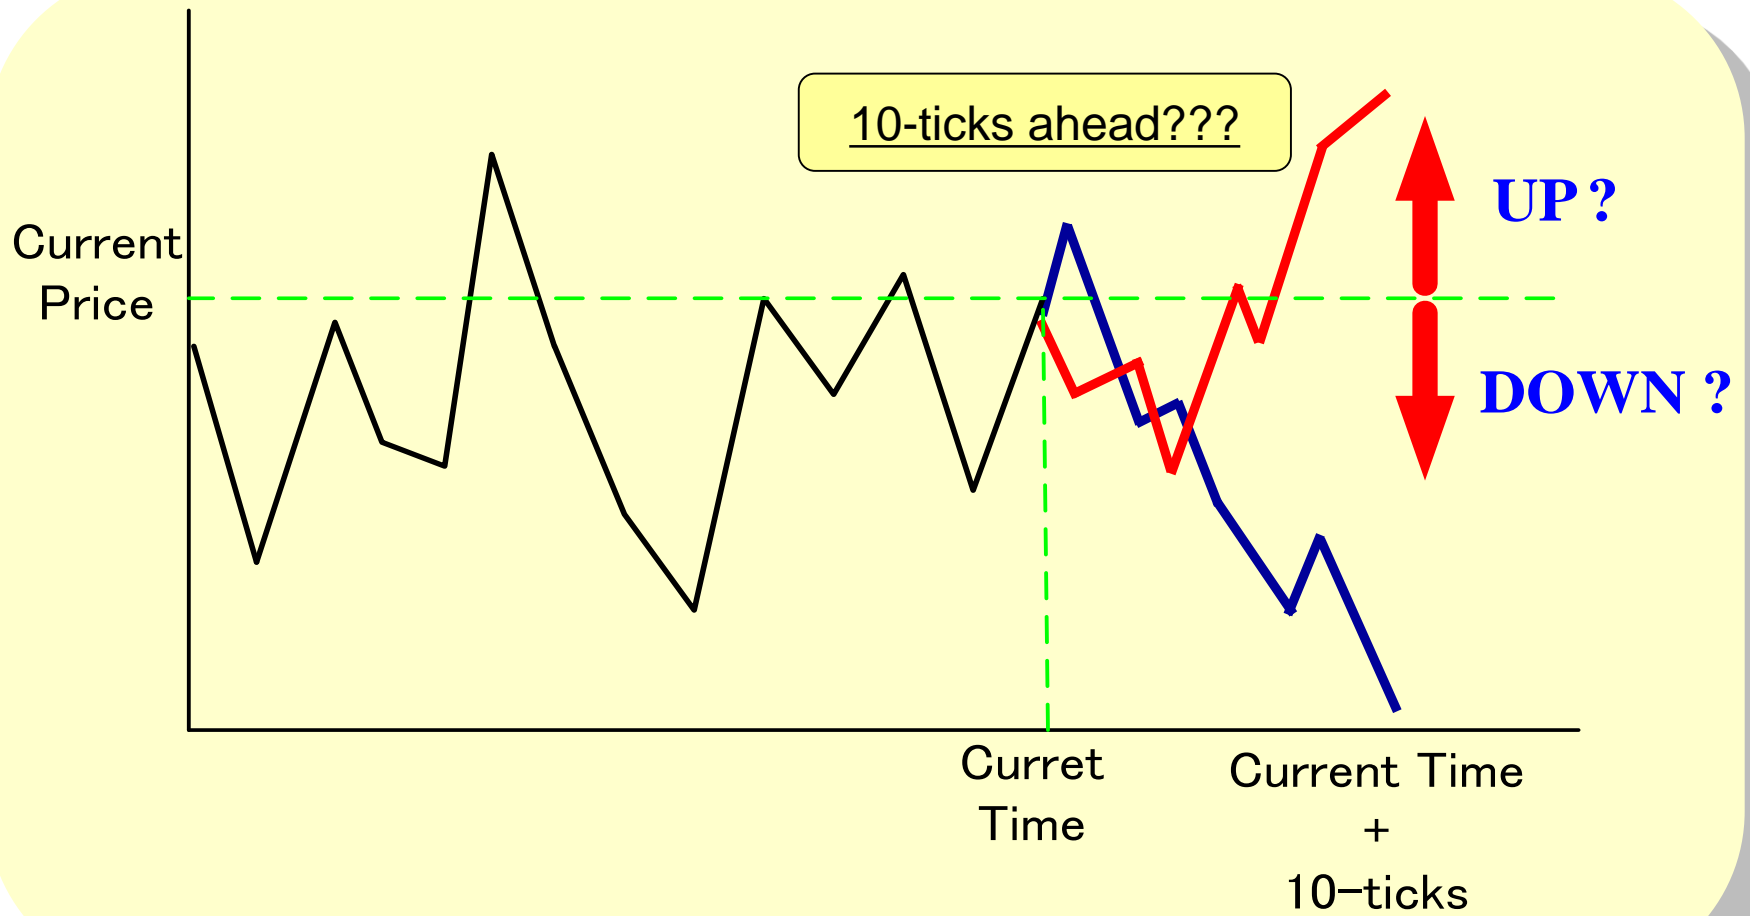

Outline

- the **existence of two different stochastic phases** in the tick-wise price fluctuations
- **improve our old method of developing the evolutionary strategy** to predict the direction of the tick-wise price movements
- **obtain a stable predictive power** even in the region where the old method had a difficulty
- Labeling the states by combination of indicators

1. Motivation

- **Can we predict the price change?**
- **Prices change randomly**
- **Rapid changes in a short time (ticks) are not the pure random walk**
- **Predict direction 2 minutes (~ hour) later**

Is Price Change Predictable?

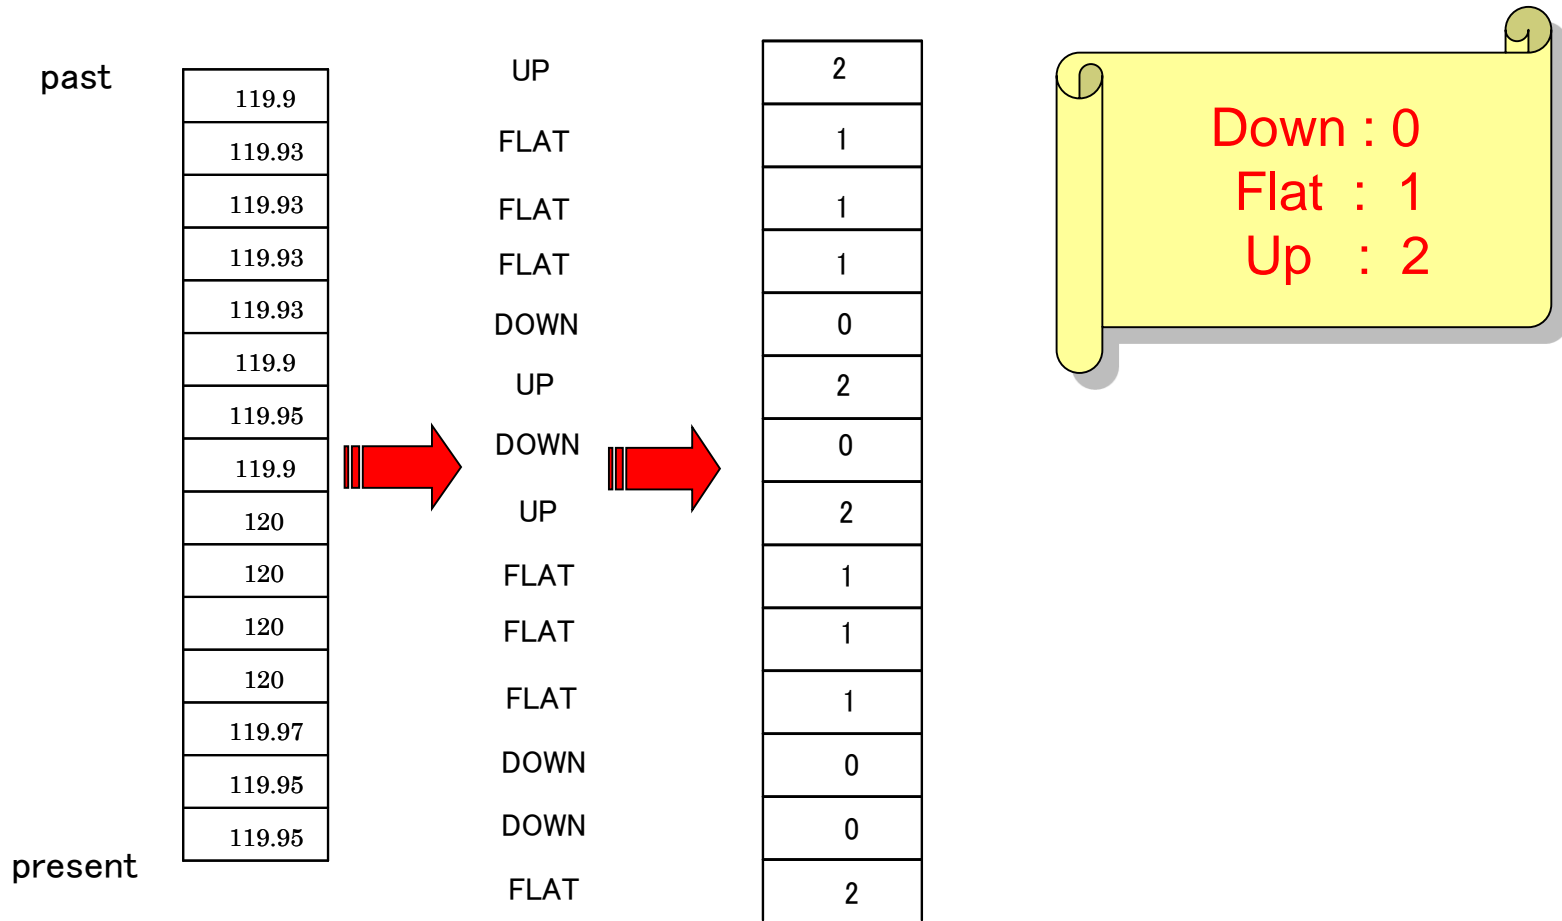

Tick-wise price fluctuation

- \$/¥ tick data (1995~2001) 6-million ticks

Date	Time	bid	ask
1992/10/1	0:00:32	119.9	120
1992/10/1	0:00:42	119.93	119.98
1992/10/1	0:00:48	119.93	120
1992/10/1	0:00:54	119.93	120
1992/10/1	0:01:06	119.93	120.03
1992/10/1	0:01:12	119.9	120
1992/10/1	0:01:30	119.95	120.05
1992/10/1	0:01:42	119.9	119.95
1992/10/1	0:02:06	120	120.05
1992/10/1	0:02:12	120	120.1
1992/10/1	0:02:18	120	120.1
1992/10/1	0:02:24	120	120.05
1992/10/1	0:02:30	119.97	120.02
1992/10/1	0:02:42	119.95	120.05
1992/10/1	0:03:00	119.95	120

Up, Flat, Down : Coding

Long-term stability in conditional probabilities in tick-wise price fluctuation (averaged over 2000-ticks)

Repulsive motion at 1-tick ahead

$$P(-|+) = 0.75$$

$$\bar{P} = \begin{pmatrix} 0.25 & 0.73 \\ 0.75 & 0.27 \end{pmatrix}$$

$$\sigma = \begin{pmatrix} 0.008 & 0.008 \\ 0.008 & 0.008 \end{pmatrix}$$

Time series of conditional probabilities
95.01/02 ~ 95.09/05

Learning the prediction strategy

$$P(\uparrow|\downarrow)=P(\downarrow|\uparrow)=0.7$$

$$P(\uparrow|\uparrow)=P(\downarrow|\downarrow)=0.3$$

- Forecast of 1 tick ahead based on the motion of immediate past

$$P(\downarrow|\uparrow\uparrow)=?$$

$$P(\downarrow|\uparrow\uparrow\uparrow)=?$$

- Forecast of 1 tick ahead based on the motions of several ticks : GA-based automated learning

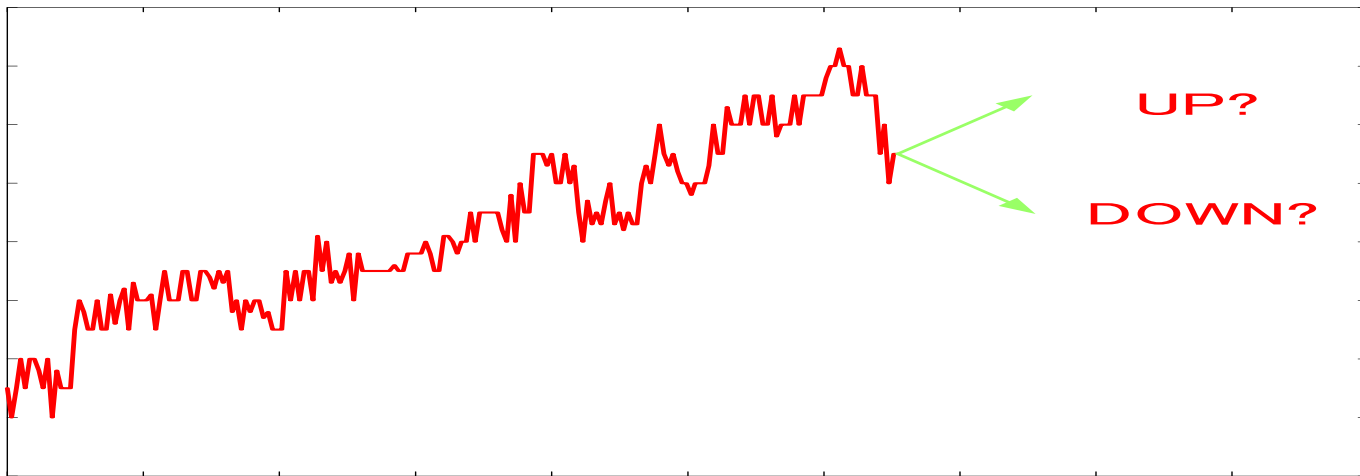

longer condition

bring such knowledge in to a
practical use : **forecast**

- by adaptively learning the pattern :
evolutional computation
- **a strategy** is regarded as a **chromosome**
- that **evolves to adapt to the environment**
offered by the real-world tick-wise price
data

Tick price has patterns → prediction

- Extracting patterns → forecast
- many patterns observed: memory length?
- T-ticks head ?

One of {down, flat, up}, very simple question !

2. Use Evolutional Algorithm

- Learn the strategy from data online
- Need sufficient time (2500 ticks in our case) to fix the strategy
- Change strategy depending on the situation
- Quick labeling of the situation is called for
- Use currently use a combination of technical indicators

Basic Method : Prediction Genome (P)

Design Gene for all the possible history

Ex). $N = 3, H=012$ case

$P = 012122 \cdots 002$

$$3^3 = 27$$

➔ **Gene = Strategy**

$$P = p_1 p_2 \cdots p_{3^N}$$

$$p_j \in \{0, 1, 2\}$$

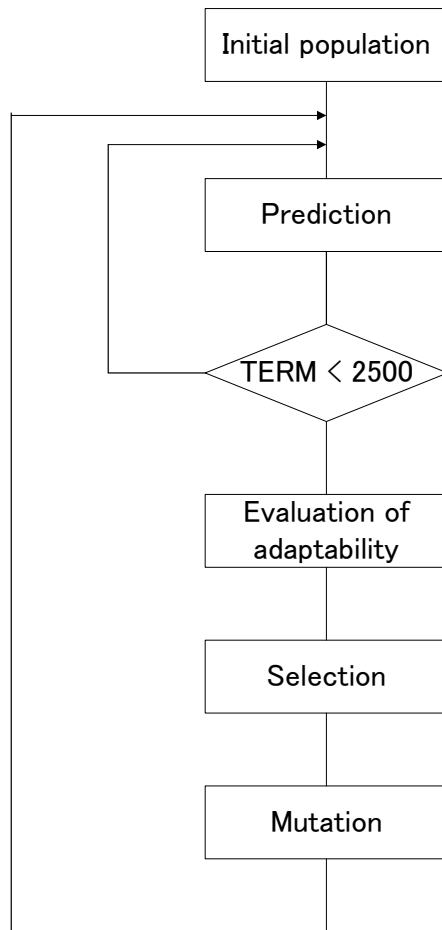

Genome length = 3^N

Genome types = 3^{3^N}

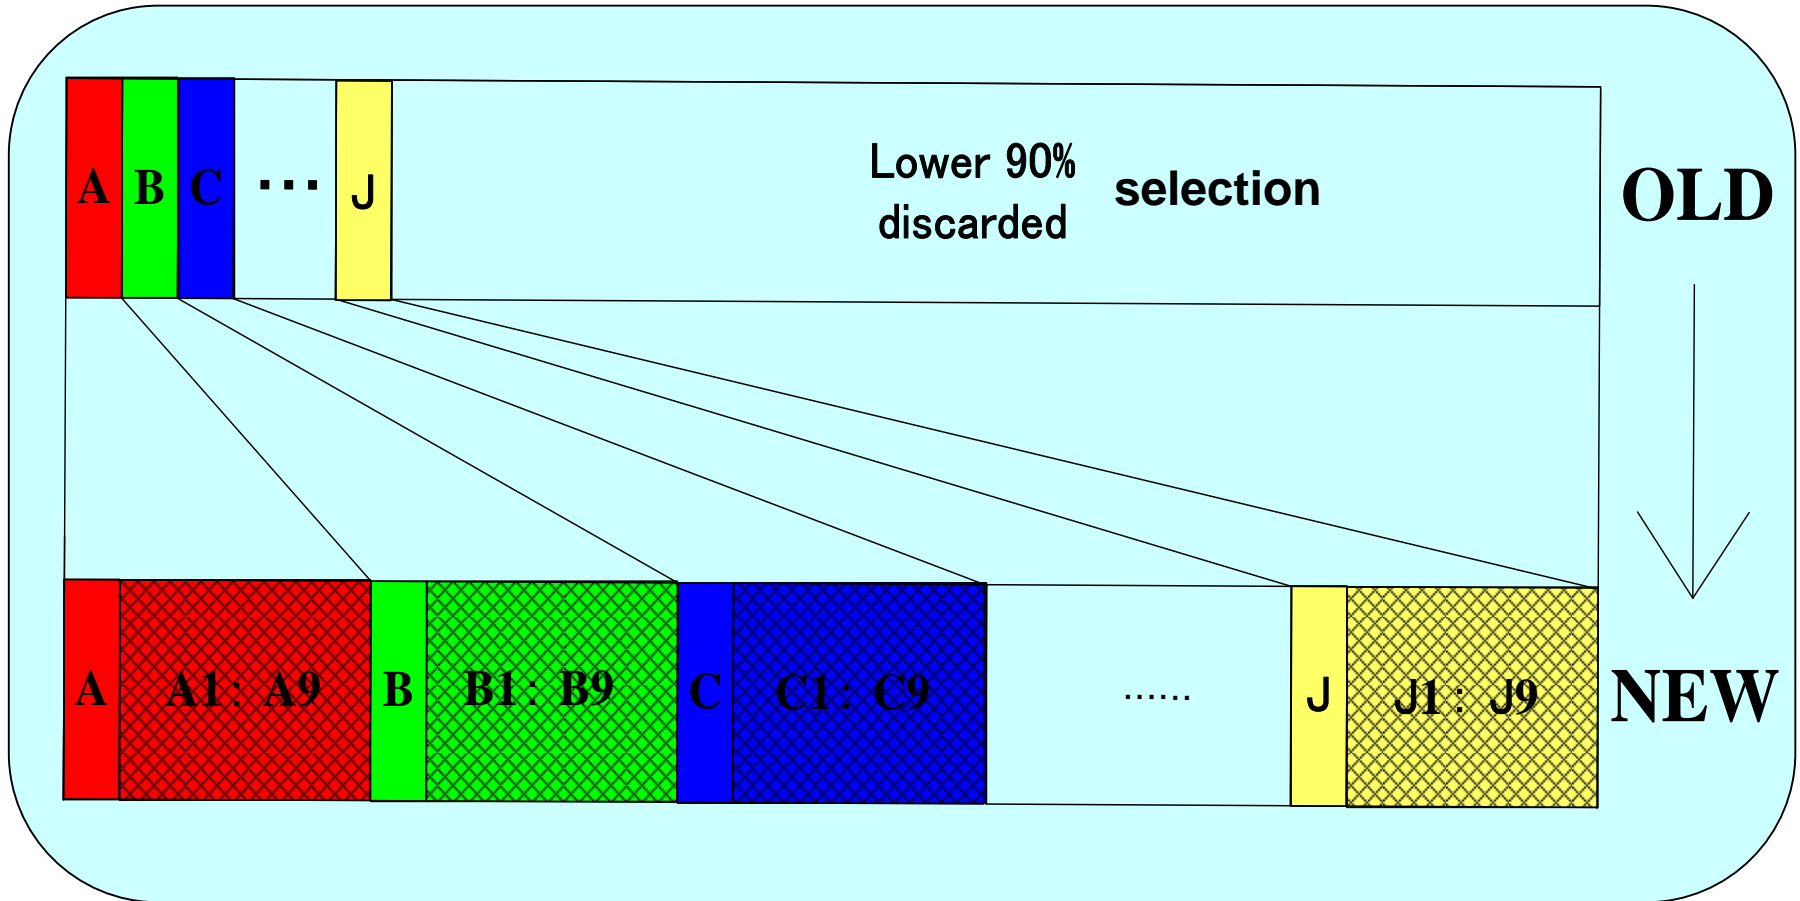

Predict 2 (up)

Evolutional Algorithm

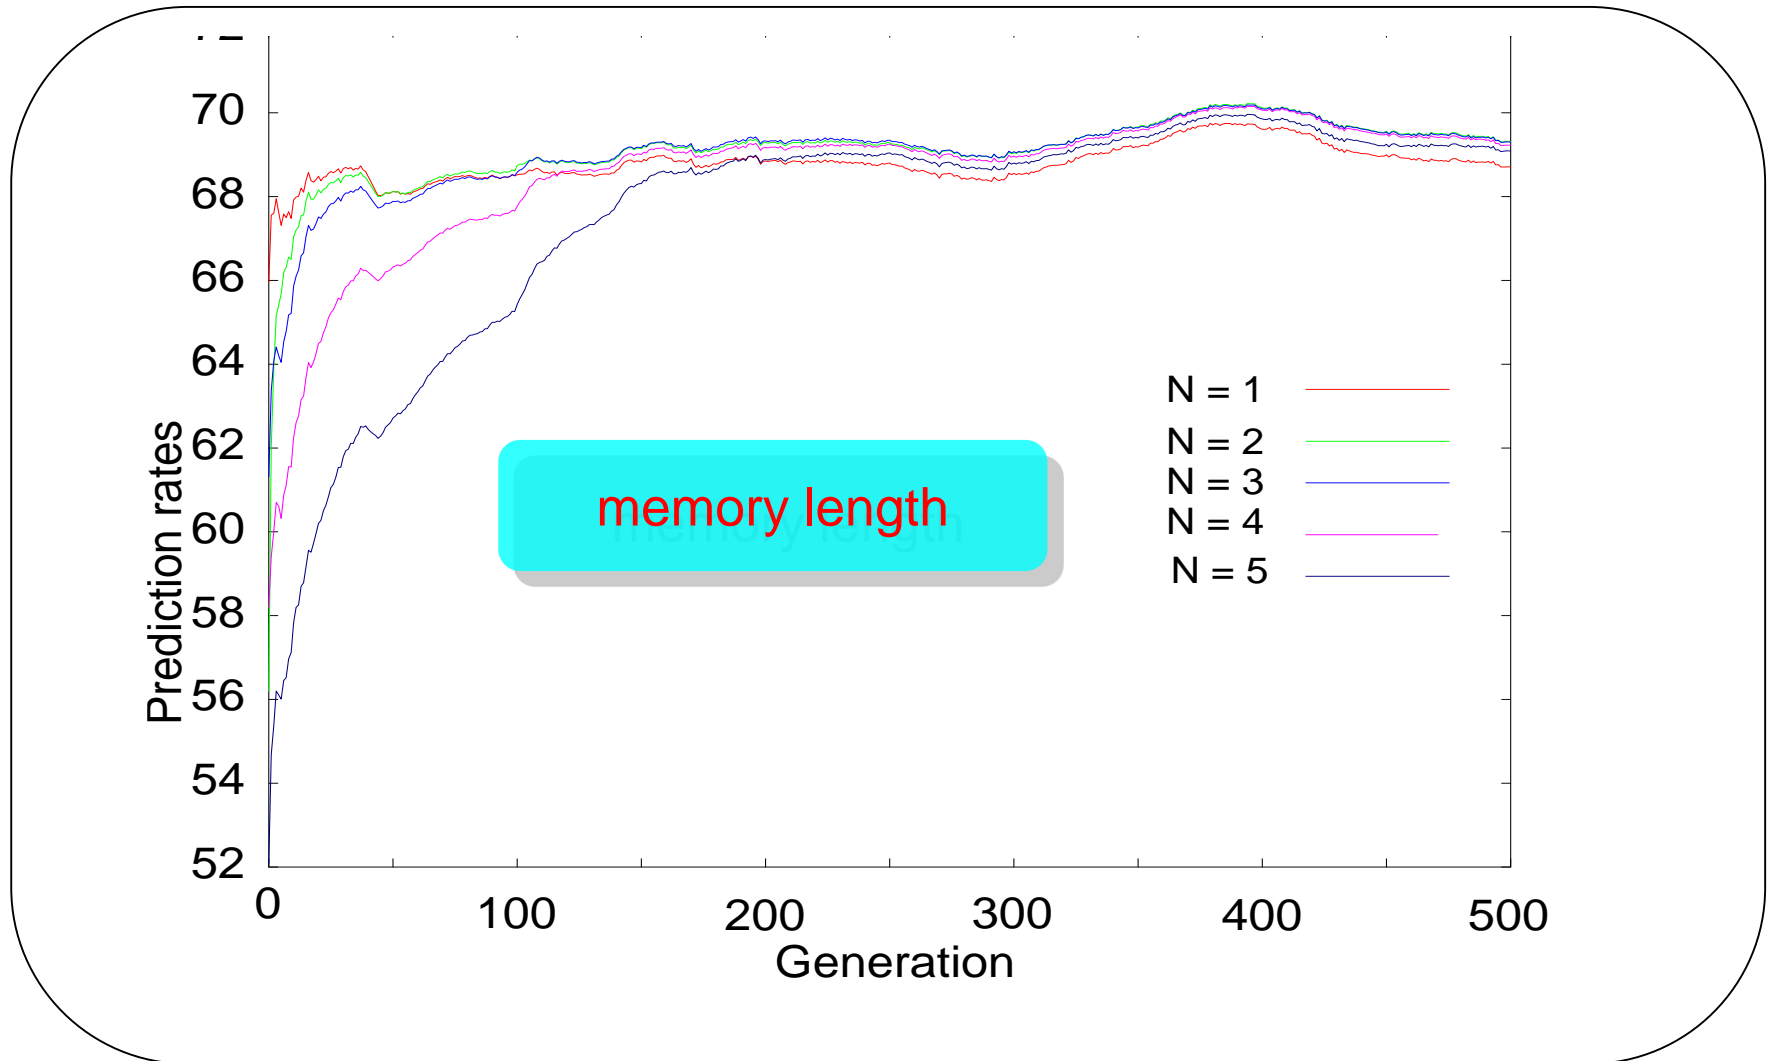

- Prepare 100 genome: initial values are random
- Count the rate of correctly predicted events out of 2500
- Evaluation function is the correctly hitting rate of predictions
- Select the best 10% genome : keep them
- Mutation: Generate mutants by changing one site randomly from each genome to fill the rest 90%

Generation change

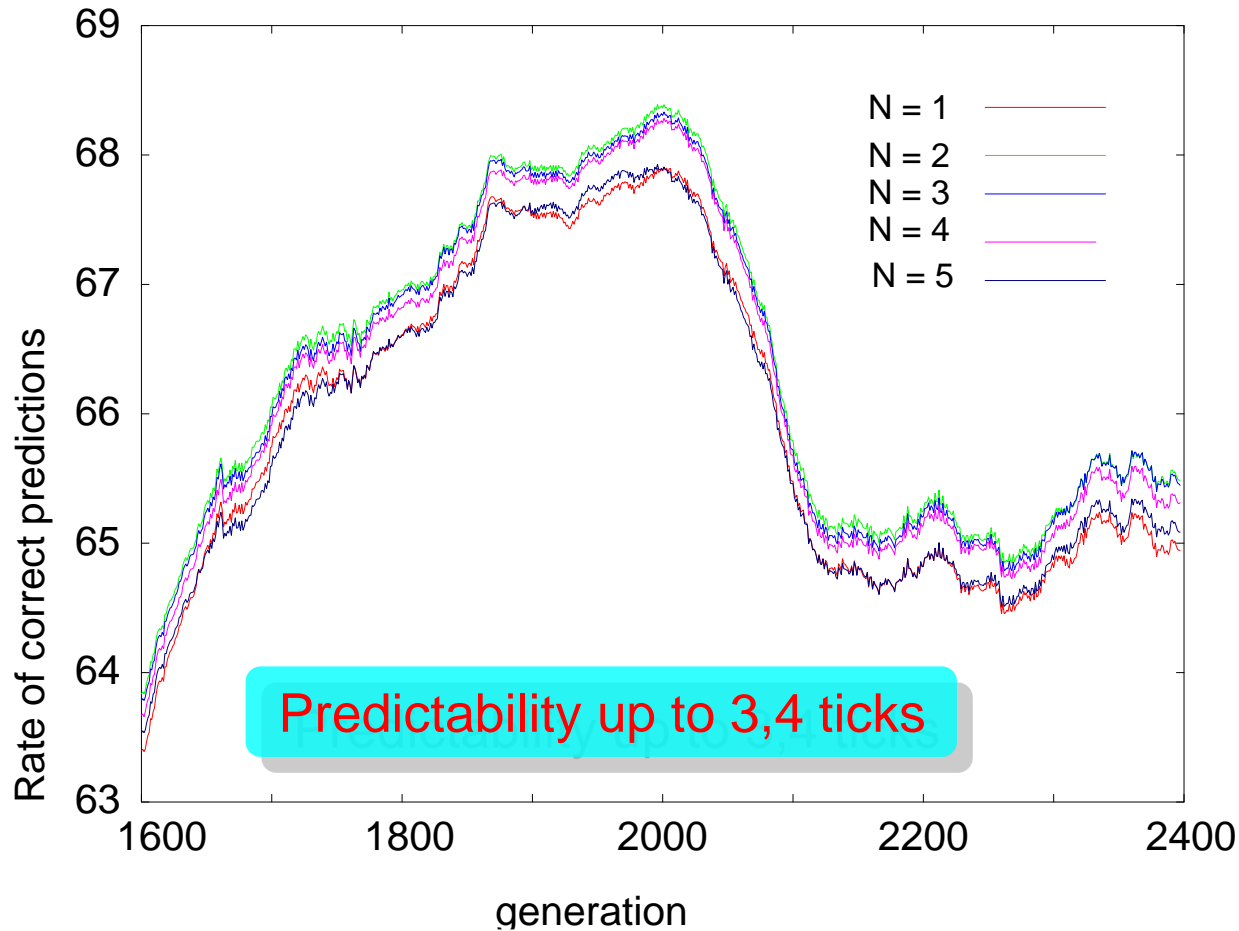

Result: Predictability based on GA leaning

(The first 500 generations are shown)

Predictability after sufficient learning period (1600-2400)

From the top to bottom N=2,3,4,5,1

3. Improvement : size effect

- Evolutional algorithm works, but there is **another phase** seen in the tick-wise price motions
- We go back to the **conditional probability** analysis and obtain a new knowledge
- Conditional probability $P(x|m)$ plays an important roll. (m = the minimum of Δprice)
- Crossing of two time series
 $P(\text{UP}|m)$ and $P(\text{DOWN}|m)$

Histogram of price increments

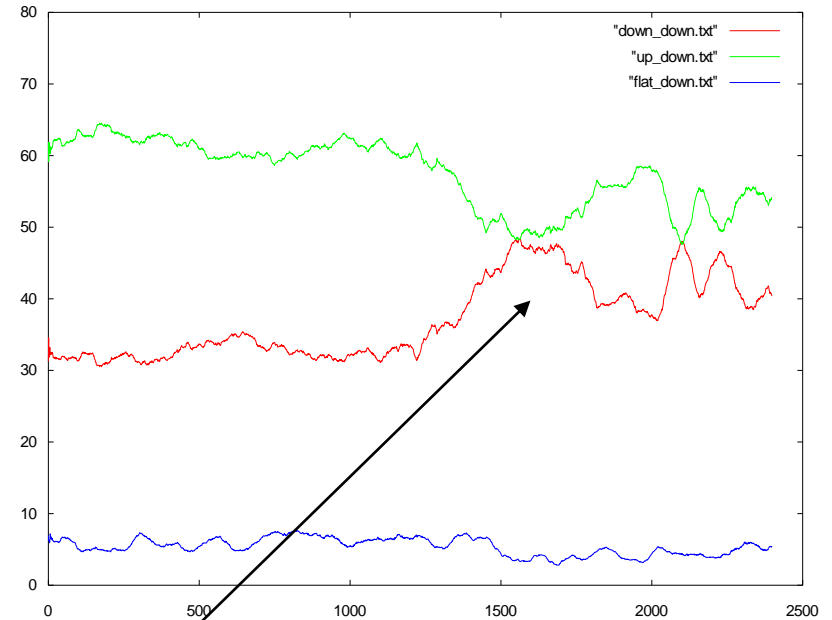

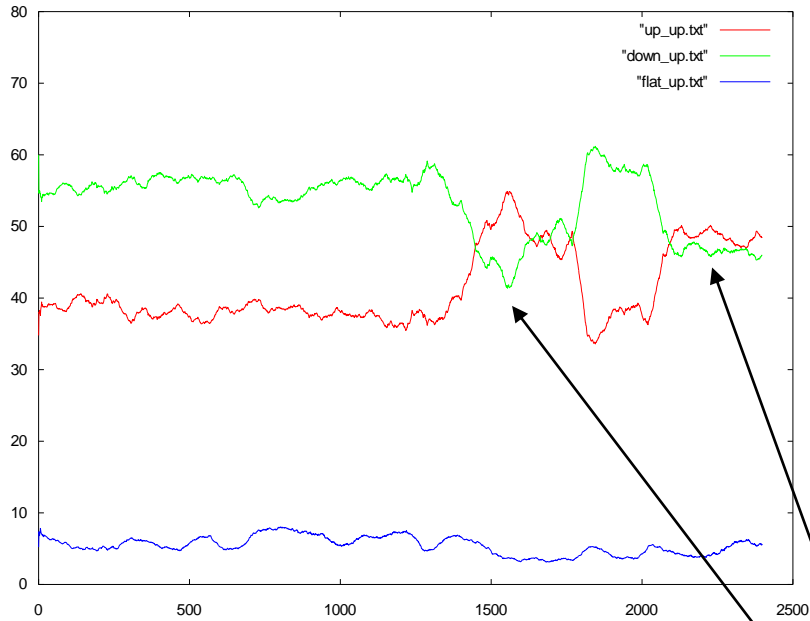

Conditional probability after ± 0.01

± 0.01 occurs most frequently

After the move of $\pm m$

One point represents condntional probability over 2500ticks

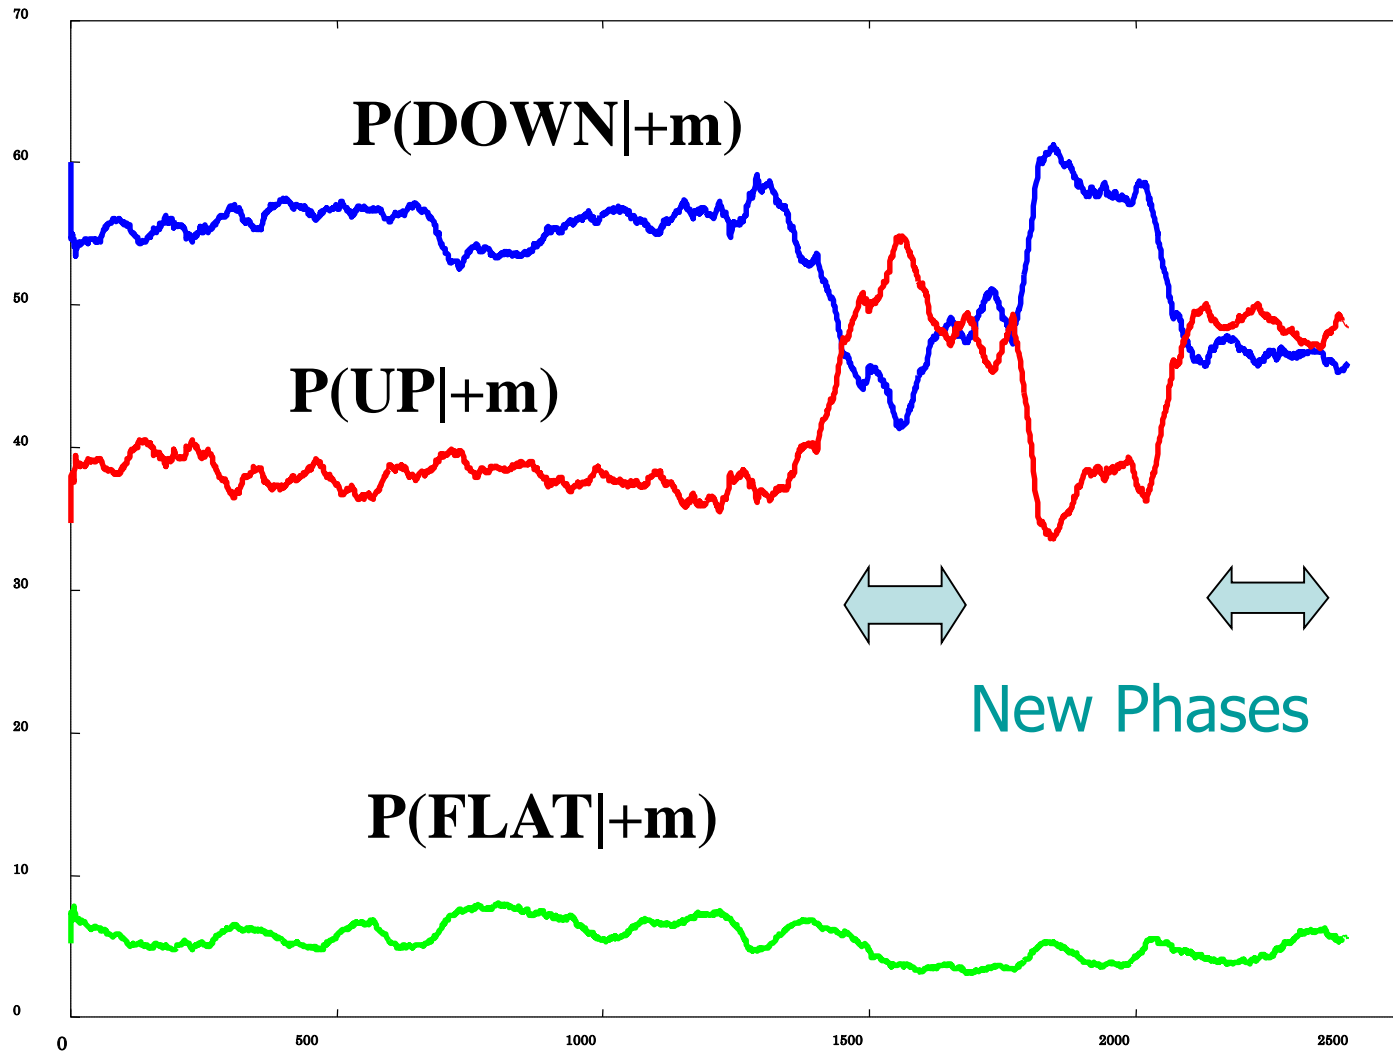

$P(x|+m)$

$P(x|-m)$

Crossings of two lines

Conditional Probabilities After a Rise by the Minimum Increment, $m=0.01$.

More states

$$H = h_1 h_2 h_3 \cdots h_N$$

$$h_i \in \{0, 1, 2, 3, 4\}$$

$$\text{History types} = 5^N$$

New Method with Size Effect and Discovery of Two Phases

- Not only the **direction of move** but also the **size of price moves** must be taken into account in this new phase.

Comparison : Basic Method (dashed) vs. New Method (solid) for N=3.

4. Labeling the different states

- Labeling by technical indicators
- Combination of technical indicators
- Optimal combination by evolutionary algorithm
- Successful in forecasting stock prices and FX prices

Technical Indicators

- **Trend Indicators**

- MA (Moving Average)
- MAD (Deviation MA)
- EMA (Exponential MA)
- MO (Momentum)
- MACD

price direction

(Moving Average Convergence and Divergence)

- **Oscillator Indicators**

- RSI (Relative Strength Index)
- RCI (Rank Correlation Index)
- PL (Psychological Line)
- Etc.....

**overbought and
oversold signals**

Data: Tick-wise Stock Price

NYSE, 8 symbols, 1993/1/1~1993/12/31

Stock symbol	Business type	Data size (ticks)	Tick interval (s/ticks)	10-ticks (minute)
BBY	retail	54821	109	18
SMRT	retail	12525	473	78
APC	oil	23685	253	42
BP	oil	73562	83	14
CA	computer	65051	92	15
IBM	computer	455233	14	2
F	automobile	194561	32	5
GM	automobile	277241	23	4

Example of trend indicator : MA

Tick price

MA
(Trend Indicators)

Example of oscillator indicator : RSI

Tick price

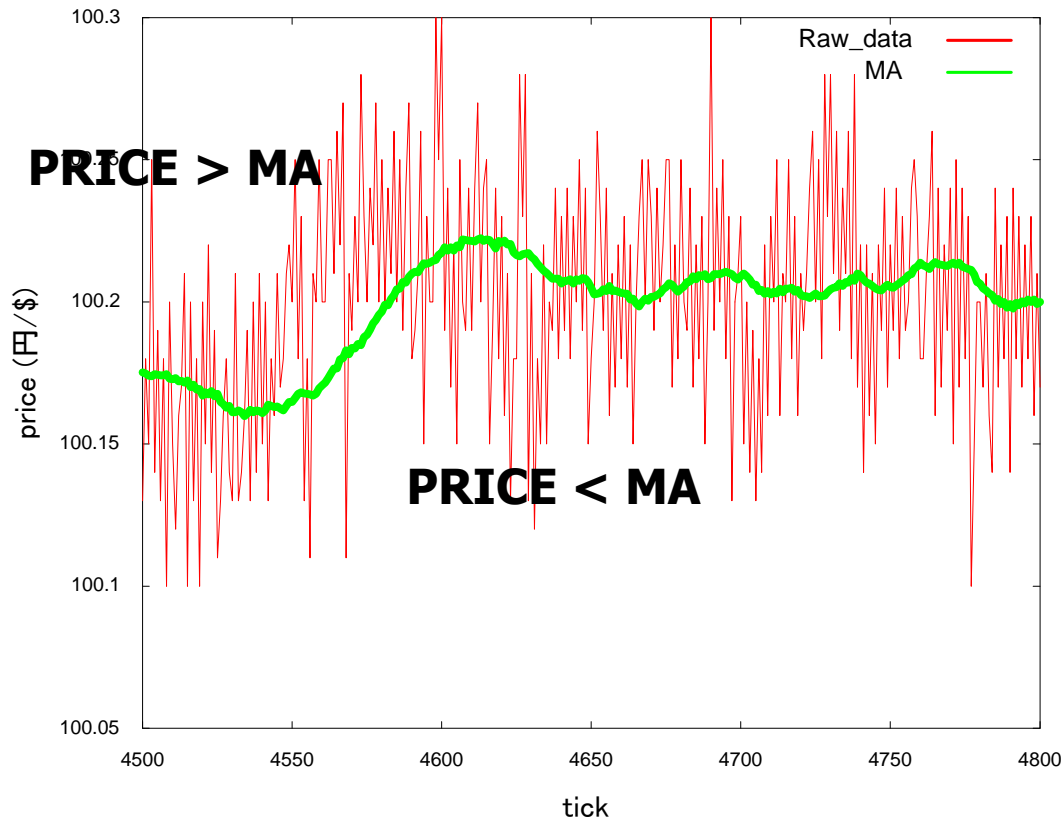

**RSI
(Oscillator
Indicators)**

Quantization of indicators : MA

- **MA takes 2 states:**

① **PRICE > MA**

or

② **PRICE < MA**

Strategy based on MA only

4 possible strategies

If (① PRICE > MA) UP && if (② PRICE < MA) UP

If (① PRICE > MA) UP && if (② PRICE < MA) DOWN

If (① PRICE > MA) DOWN && if (② PRICE < MA) UP

If (① PRICE > MA) DOWN && if (② PRICE < MA) DOWN

Tick data

Job flow

- Step1

Evaluate Indicators

Learning data

- Step 2

Evaluate and select combination of indicators

- Step 3

Generate strategies

- Step 4

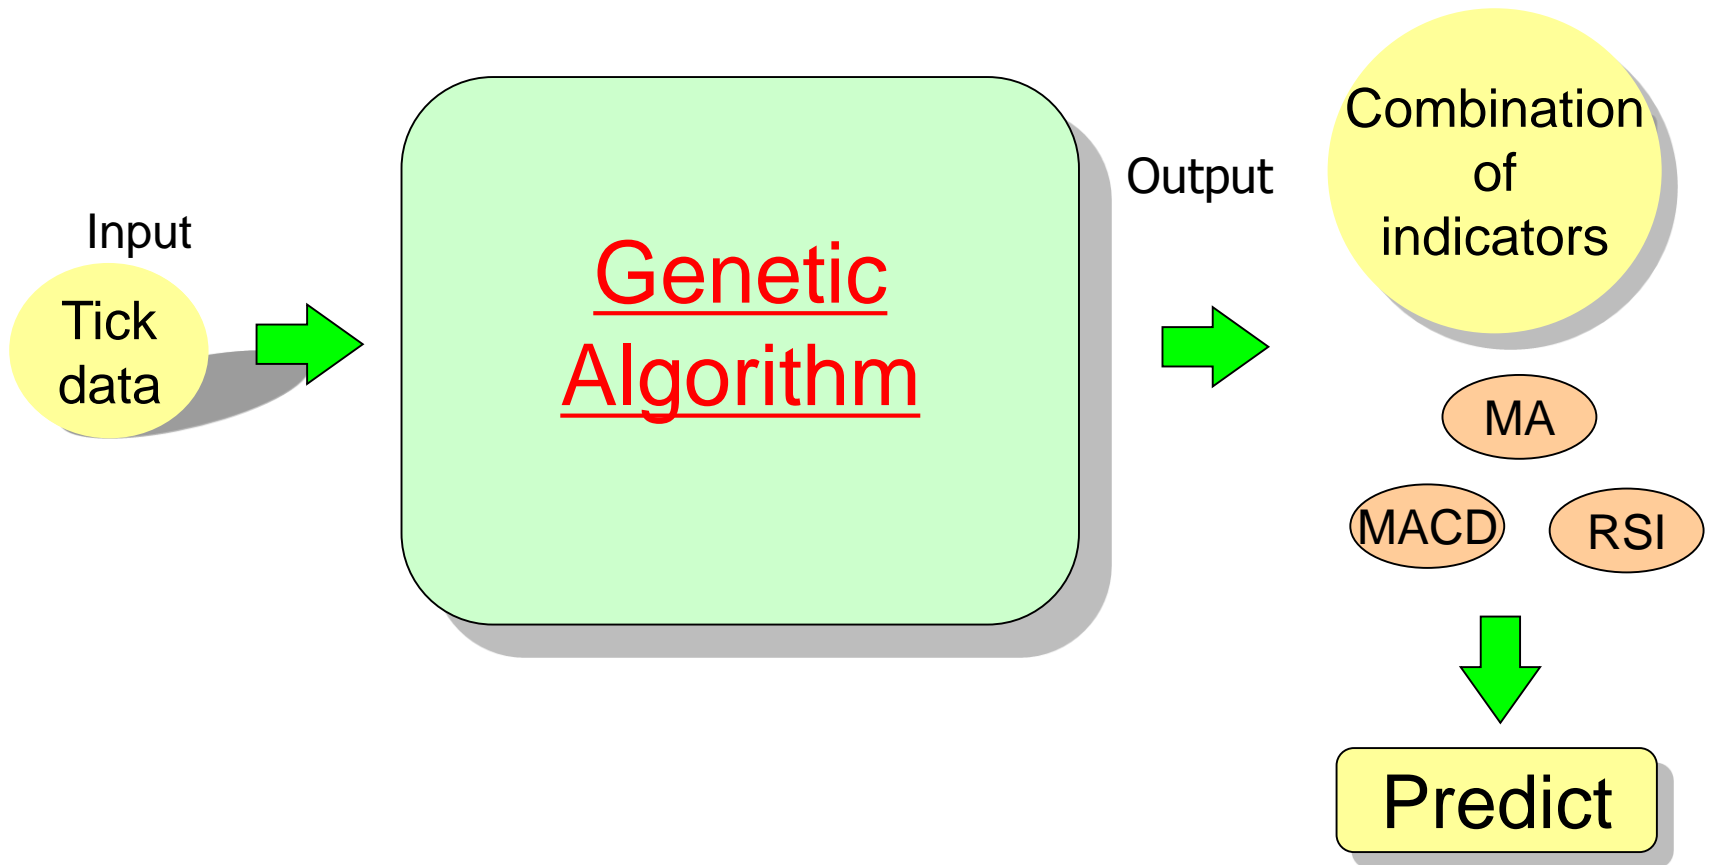

Prediction

Testdata

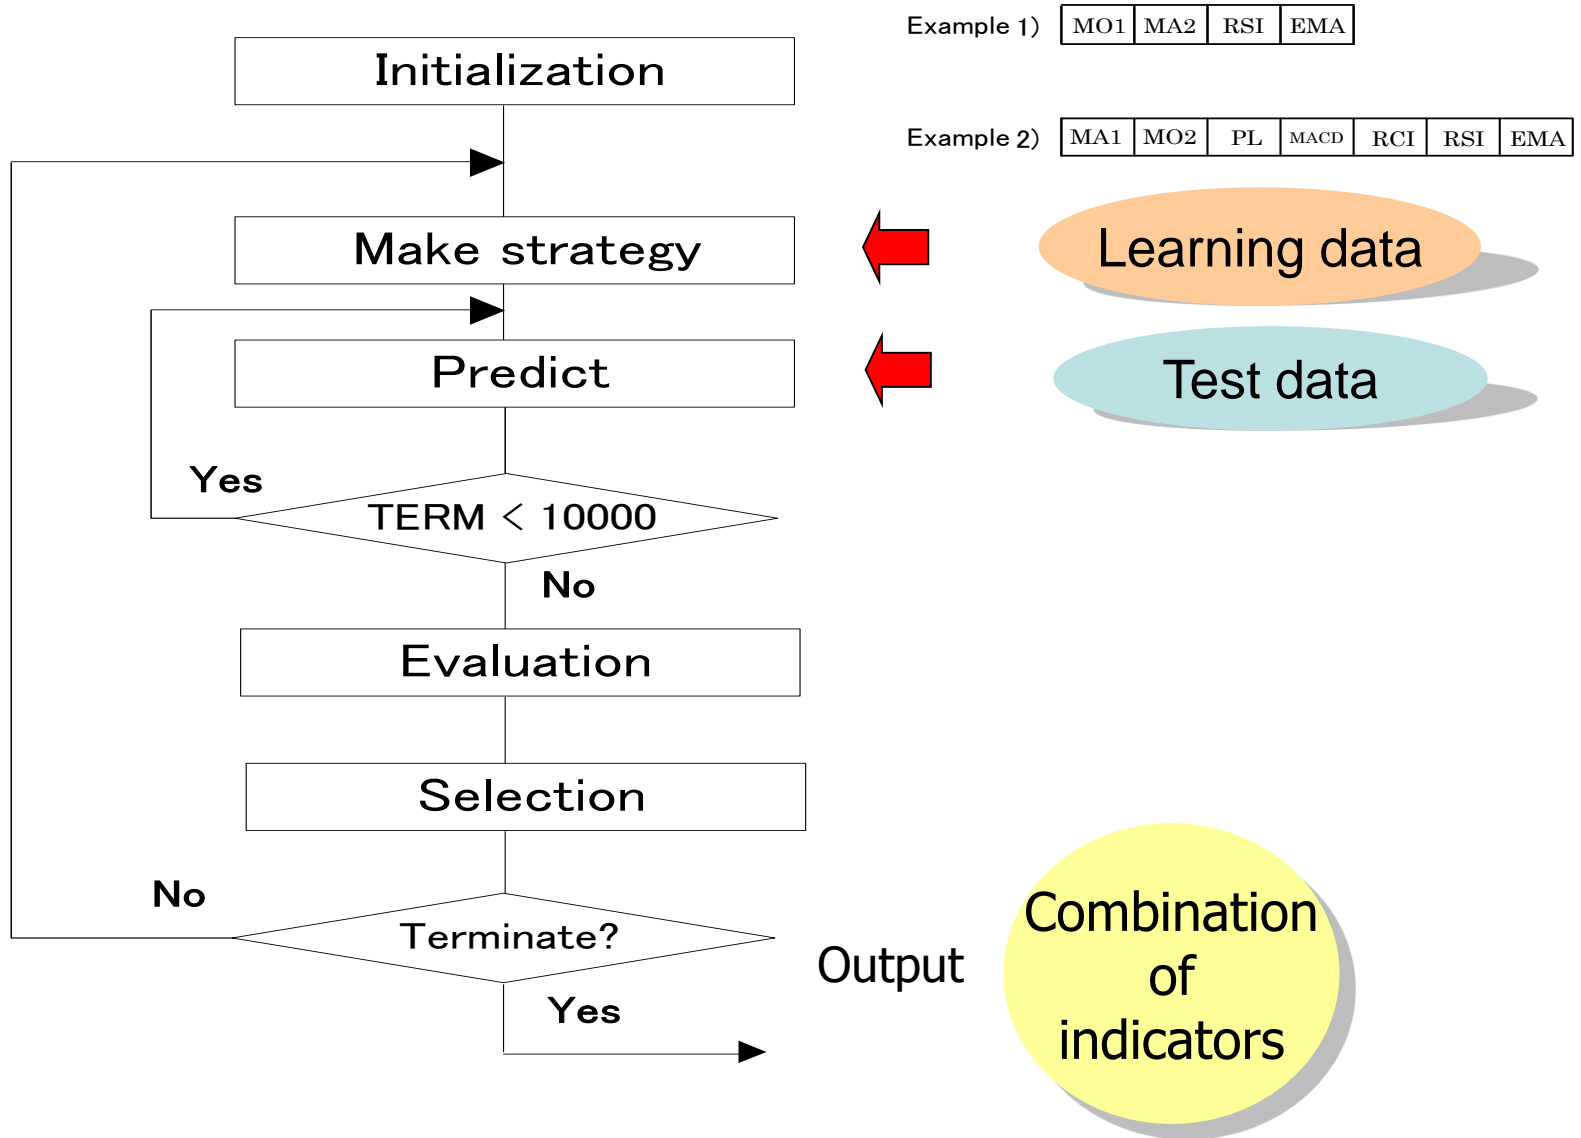

Three assumptions

- 1. Different indicator for different stock**
- 2. Combination of indicators improves the forecast**
- 3. Some indicators are more effective on tick-data**

Selection of indicators by GA

Flow of selecting indicators by GA

Genetic operations & parameters

Genetic operations

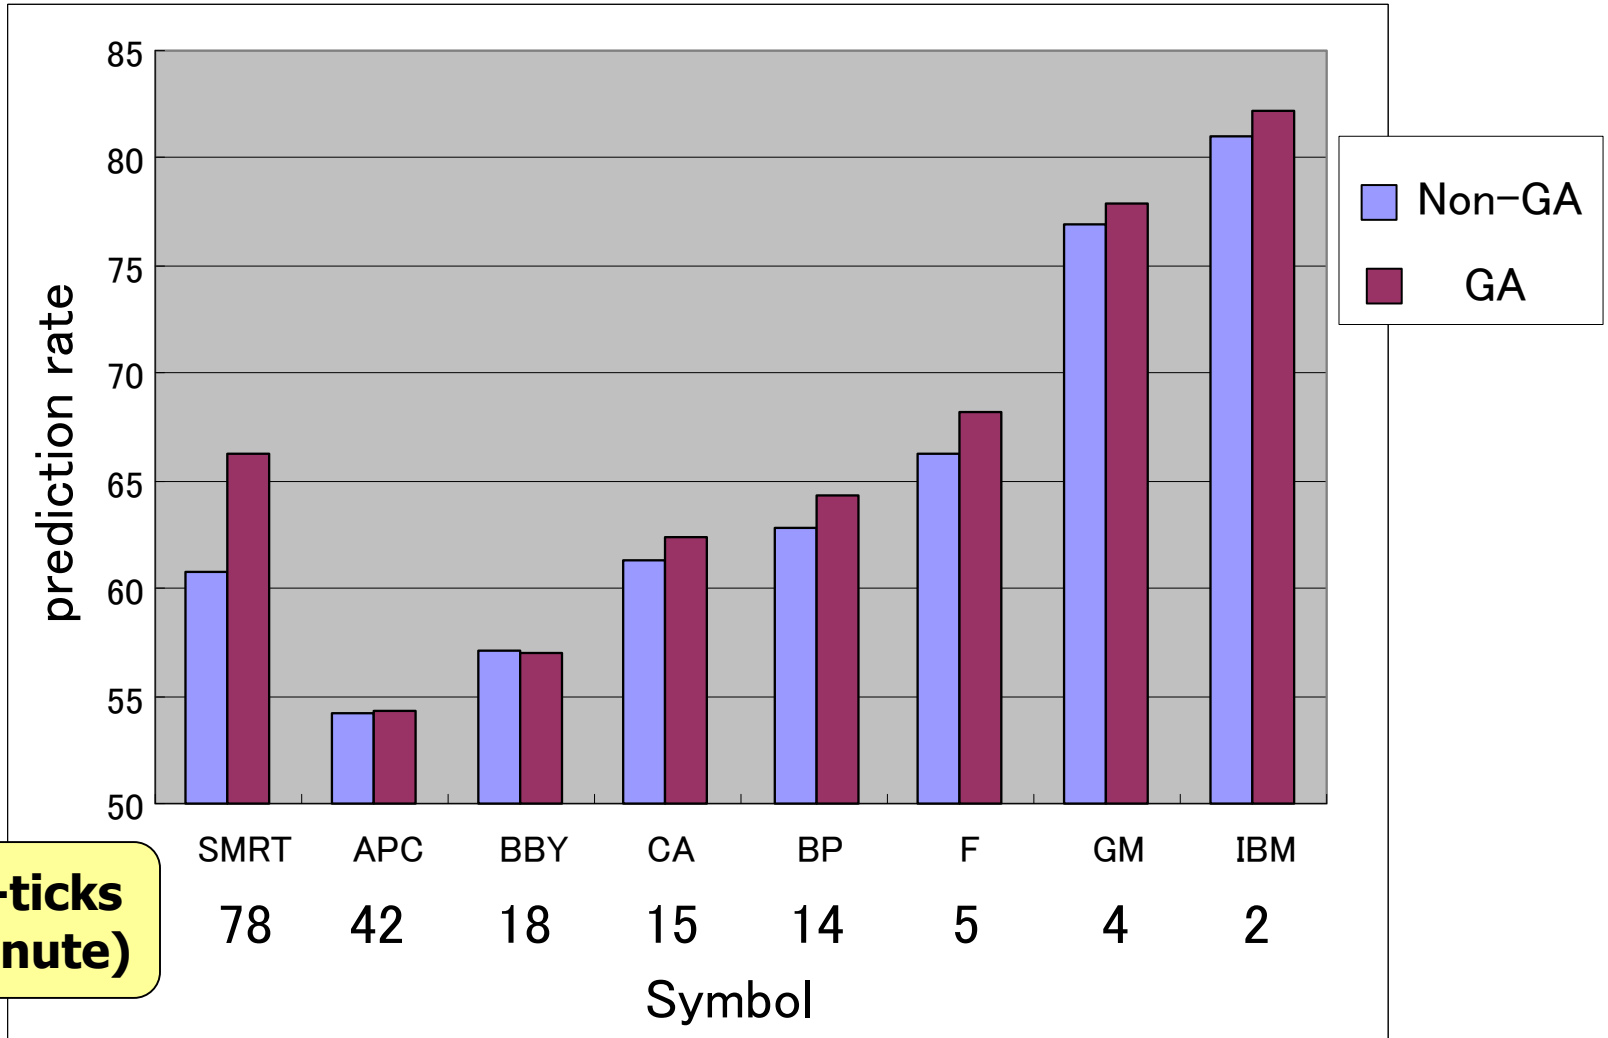

- Selection : Elite selection(10%) +
Roulette-wheel selection (90%)
- Crossover : Two-point crossover
- Parameters
 - Population : 100
 - Generation : 500
 - Crossover rate : 90%
 - Mutation rate : 1%

Combination of indicators selected by GA

	APC	BBY	BP	CA
1st	(MO1,MA1,MACD)	(MO2,RSI)	(MO2,MA2)	(MO1,MA2)
2nd	(MO1,MA1,MACD,RCI)	(MO1,RSI)	(MO2,EMA)	(MO1,MA2,MAD)
3rd	(MO1,MA1,RSI)	(RSI,RCI)	(MO2,MA1)	(MO1,MA1)

	F	GM	IBM	SMRT
1st	(MO2,MA2,EMA)	(MO2,MAD,EMA)	(MO2,MAD,EMA)	(MO2,MACD)
2nd	(MO2,MA2)	(MO2,MAD,PHL)	(MO2,MAD)	(MA2,MACD)
3rd	(MO2,MA1,EMA)	(MO2,MAD)	(MO2,EMA)	(MA2,EMA)

GA vs. Non-GA

**How many indicators
should be combined ?**

Prediction rates vs. number of indicators

➔ The prediction rate improves when two or more indicators are used

Evaluation

◎ : very effective
 ○ : effective
 △ : effective only to a part of symbol_
 × : Non-effective

	Indicator	Single	Multiple
Trend type	MA1,MA2	◎	◎
	MAD	◎	◎
	EMA	◎	◎
	MACD	×	○
	MO1,MO2	○	◎
Oscillator type	RSI	△	○
	RCI	△	○
	PHL	○	○

Trend type

×

Oscillator type

is effective_

Technical indicators seem to work

- **Predict price level 10-ticks ahead**
- **Combination of several technical indicators by GA**

- **Correct prediction in 80% for busy stocks (IBM, GM)**
- **65% for average of eight stocks**
- **Best result given by combination of 3-5 indicators**
- **Poor performance on slow stocks can be explained by the large tick intervals (approx.1-hour)**
- **Our method should perform well for other popular stocks or foreign exchange rates**

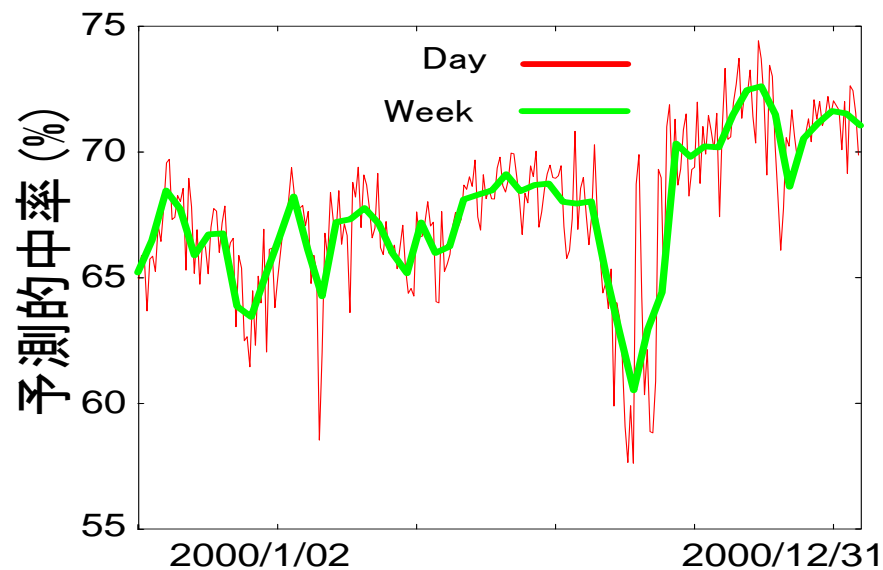

FX data USD/JPY 1996-2000

Result: Forecast of 10 ticks ahead

- Hitting rate for FX (%)

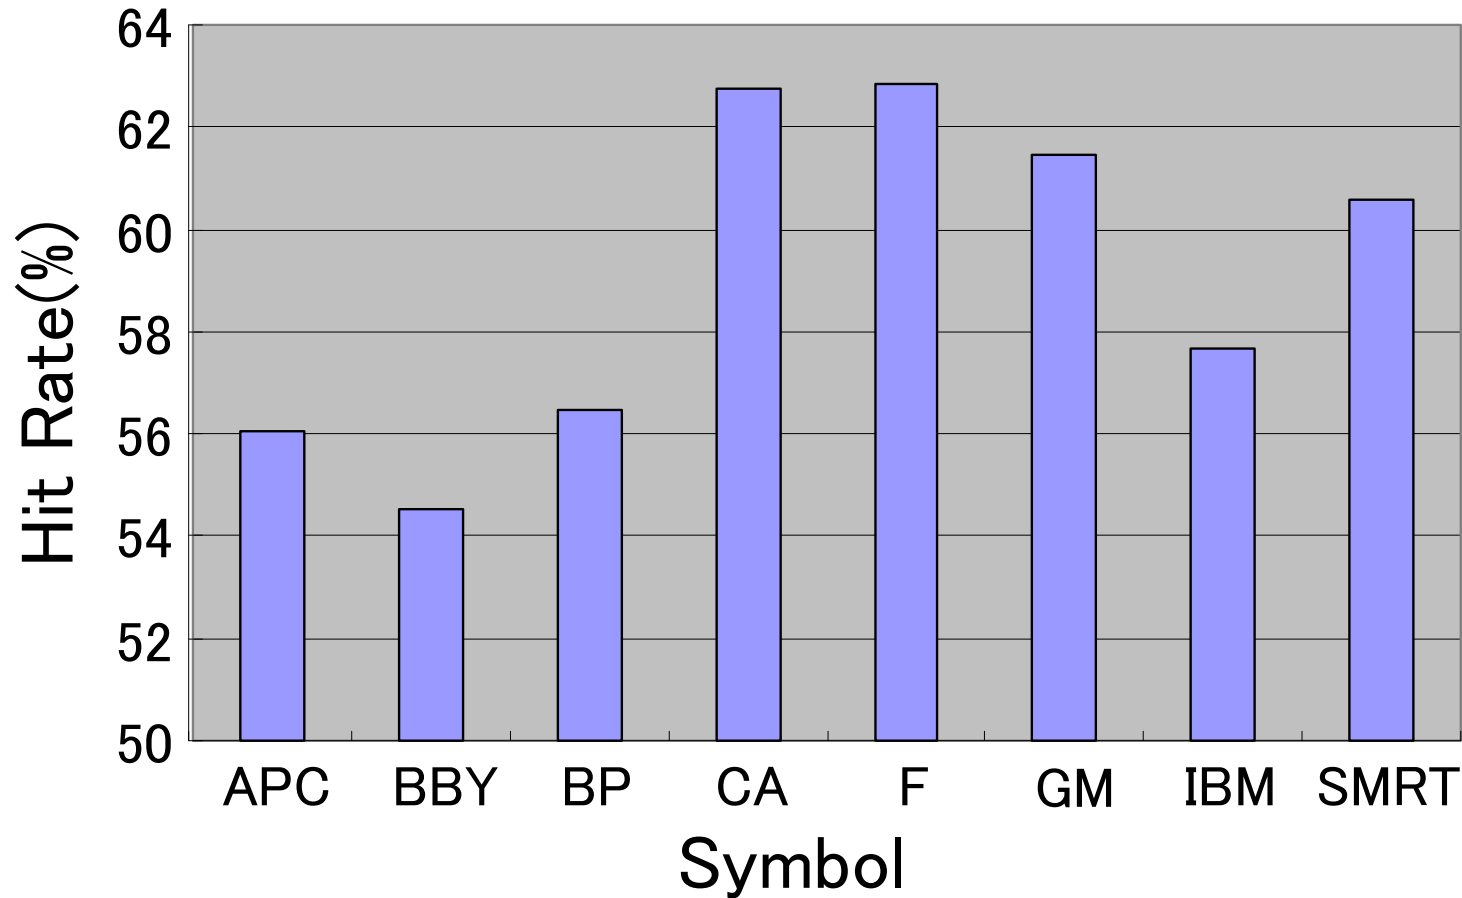

1996-2000

Monthly change (2000)

➡ 70% predictability

Monthly USD/JPY(1995-2000)

Summary

- **Automatic forecast of several ticks ahead**
- **Using the patterns observed in tick-wise price fluctuation**
- **Evolutional approach successful in terms of direction**
- **Noticing the new phase helps improving the forecast.**

Cross Correlation Spectra compared with Random Matrix Theory

Applied on tick data

NYSE-TAQ 1994 vs. 2002

Use of Random Matrix Theory

How can we separate significant information from the flood of randomness ?

A good recipe is given by

V. Plerou, P. Gopikrishnan, B. Rosenow,
L.A.N. Amaral, T. Guhr, H.E. Stanley,

“Random matrix approach to cross
correlation in financial data”,

Physical Review E 65, 066126, 2002.

Recipe 1 Correlation Matrix

Cross correlation between Stock- i and Stock- j

$$C_{i,j} = \frac{1}{L} \sum_{k=1}^L x_{i,k} x_{j,k}$$

$$x_{i,k} = \begin{vmatrix} x_{1,1} & x_{1,2} & \cdot & x_{1,L} \\ x_{2,1} & x_{2,2} & \cdot & x_{2,L} \\ \cdot & \cdot & \cdot & \cdot \\ x_{N,1} & x_{N,2} & \cdot & x_{N,L} \end{vmatrix} \leftarrow \begin{array}{l} \text{Price time series of} \\ \text{Stock-1} \end{array}$$

Data at every tick (k=1,...,L) for all N is needed!

Trouble of tick-wise stock prices

- 1) Time intervals between ticks are not regular
- 2) Not all symbols have values at every k

$N \uparrow$ means $L \downarrow$

- $L=1,512$ for every 1 hour
(10 am-3 pm = 6 pts \times 252days = 1,512)
- 1994 NYSE-TAQ : $N=419$
- 2002 NYSE-TAQ : $N=569$

Use the nearest prices to every hour

Normalized distribution of x compared to N(0,1)

$$X_{i,k} = \ln(S_{i,k+1} / S_{i,k}) \approx \Delta S_{i,k} / S_{i,k}$$

7 step recipe

- 1) Get price time series $S_{i,k}$ ($i=1,\dots, L$) for $k=1,\dots, N$ stocks
- 2) Compute return time series

$$X_{i,k} = \ln(S_{i,k+1} / S_{i,k}) \approx \Delta S_{i,k} / S_{i,k}$$

- 3) Compute $x_{i,k}$ by normalizing $X_{i,k}$ (mean=0, variance =1)

- 4) Compute cross correlation matrix $C_{i,j} = \frac{1}{L} \sum_{k=1}^L x_{i,k} x_{j,k}$

- 5) Solve eigenvalue problem of

$$C V = \lambda V$$

- 6) Compare the eigenvalues with corresponding RMT
- 7) Discrepancy is the SIGNIFICANT INFORMATION

RMT tells us..

$$\mathbf{N} \rightarrow \infty, \mathbf{L} \rightarrow \infty, \mathbf{Q} = \mathbf{L} / \mathbf{N} = \mathbf{const.}$$

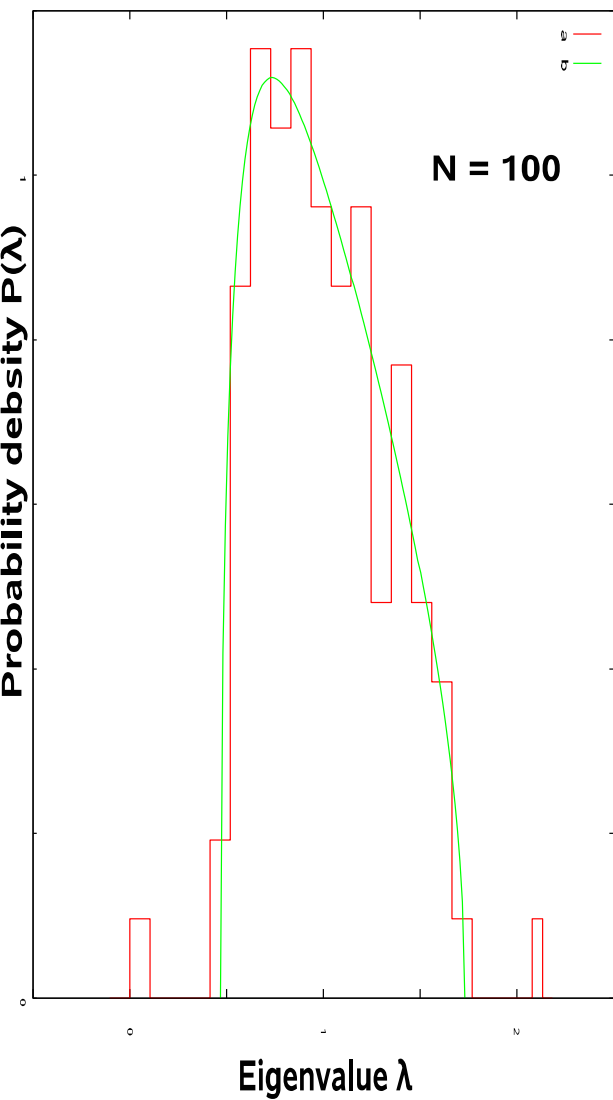

Eigenvalue (λ) distribution is given by

$$P_{\text{RMT}}(\lambda) = \frac{Q}{2\pi} \frac{\sqrt{(\lambda_+ - \lambda)(\lambda - \lambda_-)}}{\lambda}$$

$$\lambda_{\pm} = 1 + \frac{1}{Q} \pm 2\sqrt{\frac{1}{Q}}, \quad (\lambda_- < \lambda < \lambda_+)$$

Check

Comparison to RMT for various N

$\lambda_3 = 5.0$, $\lambda_4 = 3.9$, $\lambda_5 = 3.5$, $\lambda_6 = 3.4$, $\lambda_7 = 3.1$

Table3. 2002年固有ベクトル上位10成分の内訳

固有ベクトル	傾向
u1	10社中6社が金融関係、2社が銀行
u2	10社中6社が食品関係
u3	10社すべてが電気・エネルギー関係
u4	10社中5社が食品関係、3社が電気・エネルギー関係
u5	10社すべてが電気・エネルギー関係
u6	10社中3社が電気関係
u7	10社中3社が食品関係
u8	10社中8社が小売業関係
u9	10社中5社が鉱業関係、3社が通信関係
u10	10社中8社が通信関係

一時間足と日次変動の違い

- 定性的には似たような振る舞いをする
- 一時間足のほうがランダム性が強い
- 2002年には収益時系列

$$X_{i,k} = \ln(S_{i,k+1} / S_{i,k}) \approx \Delta S_{i,k} / S_{i,k}$$

を正規化した変数が正規乱数から大きく逸脱
(新しい変数が必要?)

今後の課題
