# SQUARE FUNCTIONS RELATED TO INTEGRAL OF MARCINKIEWICZ AND SOBOLEV SPACES 

## SHUICHI SATO

## Abstract. We prove a characterization of Sobolev spaces of order 2 by square

 functions related to the integral of Marcinkiewicz.
## 1. Introduction

Let $\psi$ be a function in $L^{1}\left(\mathbb{R}^{n}\right)$ satisfying

$$
\begin{equation*}
\int_{\mathbb{R}^{n}} \psi(x) d x=0 \tag{1.1}
\end{equation*}
$$

We consider the Littlewood-Paley function on $\mathbb{R}^{n}$ defined by

$$
g_{\psi}(f)(x)=\left(\int_{0}^{\infty}\left|f * \psi_{t}(x)\right|^{2} \frac{d t}{t}\right)^{1 / 2}
$$

where $\psi_{t}(x)=t^{-n} \psi\left(t^{-1} x\right)$, and a discrete parameter version of $g_{\psi}$ :

$$
\Delta_{\psi}(f)(x)=\left(\sum_{k=-\infty}^{\infty}\left|f * \psi_{2^{k}}(x)\right|^{2}\right)^{1 / 2}
$$

We recall the non-degeneracy conditions

$$
\begin{gather*}
\sup _{t>0}|\hat{\psi}(t \xi)|>0 \quad \text { for all } \xi \neq 0  \tag{1.2}\\
\sup _{k \in \mathbb{Z}}\left|\hat{\psi}\left(2^{k} \xi\right)\right|>0 \tag{1.3}
\end{gather*} \quad \text { for all } \xi \neq 0,
$$

where $\mathbb{Z}$ denotes the set of integers and the Fourier transform $\hat{\psi}$ is defined by

$$
\hat{\psi}(\xi)=\int_{\mathbb{R}^{n}} \psi(x) e^{-2 \pi i\langle x, \xi\rangle} d x, \quad\langle x, \xi\rangle=\sum_{k=1}^{n} x_{k} \xi_{k}
$$

Obviously, (1.3) implies (1.2). The weighted Lebesgue space $L_{w}^{p}\left(\mathbb{R}^{n}\right)$ with a weight $w$ is defined to be the class of all the measurable functions $f$ on $\mathbb{R}^{n}$ such that

$$
\|f\|_{p, w}=\left(\int_{\mathbb{R}^{n}}|f(x)|^{p} w(x) d x\right)^{1 / p}<\infty
$$

[^0]Then the following two theorems are known (see [11]).
Theorem A. Suppose that
(1) $B_{\epsilon}(\psi)<\infty \quad$ for some $\epsilon>0$, where $B_{\epsilon}(\psi)=\int_{|x|>1}|\psi(x)||x|^{\epsilon} d x$;
(2) $D_{u}(\psi)<\infty \quad$ for some $u>1$ with $D_{u}(\psi)=\left(\int_{|x|<1}|\psi(x)|^{u} d x\right)^{1 / u}$;
(3) $H_{\psi} \in L^{1}\left(\mathbb{R}^{n}\right)$, where $H_{\psi}(x)=\sup _{|y| \geq|x|}|\psi(y)|$;
(4) the non-degeneracy condition (1.2) holds.

Then $\|f\|_{p, w} \simeq\left\|g_{\psi}(f)\right\|_{p, w}, f \in L_{w}^{p}$, for all $p \in(1, \infty)$ and $w \in A_{p}$ (the Muckenhoupt class), where $\|f\|_{p, w} \simeq\left\|g_{\psi}(f)\right\|_{p, w}$ means that

$$
c_{1}\|f\|_{p, w} \leq\left\|g_{\psi}(f)\right\|_{p, w} \leq c_{2}\|f\|_{p, w}
$$

with positive constants $c_{1}, c_{2}$ independent of $f$.
Theorem B. We assume that
(1) $B_{\epsilon}(\psi)<\infty \quad$ for some $\epsilon>0$;
(2) $|\hat{\psi}(\xi)| \leq C|\xi|^{-\delta} \quad$ for all $\xi \in \mathbb{R}^{n} \backslash\{0\}$ with some $\delta>0$;
(3) $H_{\psi} \in L^{1}\left(\mathbb{R}^{n}\right)$;
(4) the non-degeneracy condition (1.3) holds.

Then $\|f\|_{p, w} \simeq\left\|\Delta_{\psi}(f)\right\|_{p, w}, f \in L_{w}^{p}$, for all $p \in(1, \infty)$ and $w \in A_{p}$.
The inequality $\left\|g_{\psi}(f)\right\|_{p, w} \leq c\|f\|_{p, w}$ in Theorem A was shown in [8] without the assumption (4).

The Sobolev space $W^{\alpha, p}\left(\mathbb{R}^{n}\right), \alpha>0,1<p<\infty$, consists of all the functions $f$ which can be written as $f=J_{\alpha}(g)=K_{\alpha} * g$ for some $g \in L^{p}\left(\mathbb{R}^{n}\right)$ with the Bessel potential $J_{\alpha}$, where

$$
\hat{K}_{\alpha}(\xi)=\left(1+4 \pi^{2}|\xi|^{2}\right)^{-\alpha / 2}
$$

(see [12, Chap. V]). The norm of $f$ in $W^{\alpha, p}\left(\mathbb{R}^{n}\right)$ is defined as $\|f\|_{p, \alpha}=\|g\|_{p}$. Let $0<\alpha<2$. The operator

$$
\mathcal{U}_{\alpha}(f)(x)=\left(\int_{0}^{\infty}\left|f(x)-f_{B(x, t)} f(y) d y\right|^{2} \frac{d t}{t^{1+2 \alpha}}\right)^{1 / 2}
$$

was studied in $[1]$ and used to characterize the space $W^{\alpha, p}\left(\mathbb{R}^{n}\right)$. Here we write

$$
f_{B(x, t)} f(y) d y=\frac{1}{|B(x, t)|} \int_{B(x, t)} f(y) d y,
$$

where $|B(x, t)|$ is the Lebesgue measure of a ball $B(x, t)$ in $\mathbb{R}^{n}$ with center $x$ and radius $t$.

We recall the weight class $A_{p}$ of Muckenhoupt. A weight $w$ belongs to $A_{p}, 1<$ $p<\infty$, if

$$
\sup _{B}\left(f_{B} w(x) d x\right)\left(f_{B} w(x)^{-1 /(p-1)} d x\right)^{p-1}<\infty
$$

where the supremum is taken over all balls $B$ in $\mathbb{R}^{n}$ (see [4]).

Let $1<p<\infty, \alpha>0$ and $w \in A_{p}$. Then $J_{\alpha}(g) \in L_{w}^{p}$ if $g \in L_{w}^{p}$, since it is known that $\left|J_{\alpha}(g)\right| \leq C M(g)$, where $M$ denotes the Hardy-Littlewood maximal operator defined by

$$
M(f)(x)=\sup _{t>0} f_{B(x, t)}|f(y)| d y
$$

The weighted Sobolev space $W_{w}^{\alpha, p}\left(\mathbb{R}^{n}\right)$ is defined as the collection of all the functions $f \in L_{w}^{p}\left(\mathbb{R}^{n}\right)$ which can be expressed as $f=J_{\alpha}(g)$ for some $g \in L_{w}^{p}\left(\mathbb{R}^{n}\right)$; such $g$ is uniquely determined and the norm is defined to be $\|f\|_{p, \alpha, w}=\|g\|_{p, w}$.

Theorems A, B can be applied to characterize the weighted Sobolev spaces $W_{w}^{\alpha, p}\left(\mathbb{R}^{n}\right)$ by square functions related to the Marcinkiewicz function including $\mathcal{U}_{\alpha}(f)$ and

$$
\left(\sum_{k=-\infty}^{\infty}\left|f(x)-f_{B\left(x, 2^{k}\right)} f(y) d y\right|^{2} 2^{-2 k \alpha}\right)^{1 / 2}, \quad \alpha>0
$$

The Marcinkiewicz function was introduced by [7] (see [9] for some background materials).

We say $\Phi \in \mathcal{M}^{\alpha}\left(\mathbb{R}^{n}\right), \alpha>0$, if $\Phi$ is a compactly supported, bounded function on $\mathbb{R}^{n}$ satisfying $\int_{\mathbb{R}^{n}} \Phi(x) d x=1$; if $\alpha \geq 1$, we further assume that

$$
\begin{equation*}
\int_{\mathbb{R}^{n}} \Phi(x) x^{\gamma} d x=0, \quad x^{\gamma}=x_{1}^{\gamma_{1}} \ldots x_{n}^{\gamma_{n}}, \quad \text { for all } \gamma \text { with } 1 \leq|\gamma| \leq[\alpha] \tag{1.4}
\end{equation*}
$$

where $\gamma=\left(\gamma_{1}, \ldots, \gamma_{n}\right), \gamma_{j} \in \mathbb{Z}, \gamma_{j} \geq 0$, is a multi-index and $|\gamma|=\gamma_{1}+\cdots+\gamma_{n}$; also $[\alpha]$ denotes the largest integer not exceeding $\alpha$. Let

$$
\begin{gather*}
U_{\alpha}(f)(x)=\left(\int_{0}^{\infty}\left|f(x)-\Phi_{t} * f(x)\right|^{2} \frac{d t}{t^{1+2 \alpha}}\right)^{1 / 2}, \quad \alpha>0  \tag{1.5}\\
E_{\alpha}(f)(x)=\left(\sum_{k=-\infty}^{\infty}\left|f(x)-\Phi_{2^{k}} * f(x)\right|^{2} 2^{-2 k \alpha}\right)^{1 / 2}, \quad \alpha>0
\end{gather*}
$$

with $\Phi \in \mathcal{M}^{\alpha}\left(\mathbb{R}^{n}\right)$.
Then the following results are known (see [11]).
Theorem C. Let $1<p<\infty, w \in A_{p}$ and $0<\alpha<n$. Let $U_{\alpha}$ be as in (1.5). Then $f \in W_{w}^{\alpha, p}\left(\mathbb{R}^{n}\right)$ if and only if $f \in L_{w}^{p}$ and $U_{\alpha}(f) \in L_{w}^{p}$; furthermore,

$$
\|f\|_{p, \alpha, w} \simeq\|f\|_{p, w}+\left\|U_{\alpha}(f)\right\|_{p, w}
$$

Theorem D. Suppose that $1<p<\infty, w \in A_{p}$ and $0<\alpha<n$. Let $E_{\alpha}$ be as in (1.6). Then $f \in W_{w}^{\alpha, p}\left(\mathbb{R}^{n}\right)$ if and only if $f \in L_{w}^{p}$ and $E_{\alpha}(f) \in L_{w}^{p}$; also,

$$
\|f\|_{p, \alpha, w} \simeq\|f\|_{p, w}+\left\|E_{\alpha}(f)\right\|_{p, w}
$$

See $[6,10]$ for relevant results.
In this note we consider another characterization of $W_{w}^{2, p}\left(\mathbb{R}^{n}\right)$ by certain square functions relative to the integral of Marcinkiewicz when $n \geq 3$, which extends to the cases $n=1,2$.

Let $\Phi \in \mathcal{M}^{1}\left(\mathbb{R}^{n}\right)$. We assume

$$
\begin{equation*}
\int_{\mathbb{R}^{n}} \Phi(x) x_{j}^{2} d x=\frac{1}{n} \int_{\mathbb{R}^{n}} \Phi(x)|x|^{2} d x=b_{0} \quad \text { for all } j, 1 \leq j \leq n . \tag{1.7}
\end{equation*}
$$

When $n \geq 2$, we also assume

$$
\begin{equation*}
\int_{\mathbb{R}^{n}} \Phi(x) x_{j} x_{k} d x=0 \quad \text { for all } j, k, 1 \leq j, k \leq n \text { with } j \neq k . \tag{1.8}
\end{equation*}
$$

Let $I_{\alpha}$ be the Riesz potential operator defined by

$$
\begin{equation*}
\widehat{I_{\alpha}(f)}(\xi)=(2 \pi|\xi|)^{-\alpha} \hat{f}(\xi), \quad 0<\alpha<n \tag{1.9}
\end{equation*}
$$

Let $L_{\alpha}(x)=\tau(\alpha)|x|^{\alpha-n}$, where

$$
\tau(\alpha)=\frac{\Gamma\left(\frac{n}{2}-\frac{\alpha}{2}\right)}{\pi^{\frac{n}{2}} 2^{\alpha} \Gamma\left(\frac{\alpha}{2}\right)} .
$$

Then $\widehat{L}_{\alpha}(\xi)=(2 \pi|\xi|)^{-\alpha}, 0<\alpha<n$.
Let $n \geq 3$. Define

$$
\begin{equation*}
\psi(x)=\Phi * L_{2}(x)-L_{2}(x)+c_{0} \Phi(x) \tag{1.10}
\end{equation*}
$$

with $c_{0}=b_{0} / 2$ and $\Phi \in \mathcal{M}^{1}\left(\mathbb{R}^{n}\right)$ satisfying (1.7) and (1.8); when $n=1$ and $n=2$, we have analogues of (1.10) in (5.5) and (4.4) below, respectively. Applying Theorems A and B , we have the following results.
Theorem 1.1. Suppose that $n \geq 3$. Let $w \in A_{p}, p \in(1, \infty)$. Let $\psi$ be as in (1.10) with $\Phi \in \mathcal{M}^{1}\left(\mathbb{R}^{n}\right)$ satisfying (1.7) and (1.8). Suppose that the non-degeneracy condition (1.2) holds. Then

$$
\|f\|_{p, w} \simeq\left\|g_{\psi}(f)\right\|_{p, w}, \quad f \in L_{w}^{p} .
$$

Theorem 1.2. Let $n \geq 3$. Let $\Phi$ be a function in $\mathcal{M}^{1}\left(\mathbb{R}^{n}\right)$ with (1.7), (1.8) and let $\psi$ be as in (1.10). We assume that

$$
\begin{equation*}
|\hat{\Phi}(\xi)| \leq C|\xi|^{-\delta} \quad \text { for all } \xi \in \mathbb{R}^{n} \backslash\{0\} \text { with some } \delta>0 \tag{1.11}
\end{equation*}
$$

and that the non-degeneracy condition (1.3) holds. Then we have

$$
\|f\|_{p, w} \simeq\left\|\Delta_{\psi}(f)\right\|_{p, w}, \quad f \in L_{w}^{p}
$$

for all $p \in(1, \infty)$ and $w \in A_{p}$.
Theorems 1.1 and 1.2 will be used to prove Theorems 1.4 and 1.5 below for $n \geq 3$, respectively.
Proof of Theorem 1.1. Suppose that $\operatorname{supp}(\Phi) \subset\{|x| \leq M\}$. Then we have $|\psi(x)| \leq$ $C|x|^{2-n}$ if $|x| \leq 2 M$. Let $|x| \geq 2 M$. Then, applying Taylor's formula, by (1.7), (1.8) and (1.4) with $|\gamma|=1$ we see that

$$
\begin{aligned}
L_{2} * \Phi(x)-L_{2}(x) & =\tau(2) \int_{\mathbb{R}^{n}}\left(|x-y|^{2-n}-|x|^{2-n}\right) \Phi(y) d y \\
& =\frac{1}{2} \int_{\mathbb{R}^{n}} \sum_{j=1}^{n} y_{j}^{2} \partial_{j}^{2} L_{2}(x) \Phi(y) d y+O\left(|x|^{-n-1}\right)
\end{aligned}
$$

$$
\begin{aligned}
& =\frac{1}{2} b_{0} \sum_{j=1}^{n} \partial_{j}^{2} L_{2}(x)+O\left(|x|^{-n-1}\right) \\
& =O\left(|x|^{-n-1}\right)
\end{aligned}
$$

as $|x| \rightarrow \infty$, where the last equality follows from $\Delta L_{2}(x)=\sum_{j=1}^{n} \partial_{j}^{2} L_{2}(x)=0$, $\partial_{j}=\partial / \partial x_{j}$.

We see that

$$
\hat{\psi}(\xi)=(2 \pi|\xi|)^{-2} \hat{\Phi}(\xi)-(2 \pi|\xi|)^{-2}+c_{0} \hat{\Phi}(\xi)=(2 \pi|\xi|)^{-2}(\hat{\Phi}(\xi)-1)+c_{0} \hat{\Phi}(\xi)
$$

Also, by (1.7), (1.8) and (1.4) with $|\gamma|=1$, we have

$$
\begin{aligned}
\hat{\Phi}(\xi) & =\int_{\mathbb{R}^{n}} \Phi(x) e^{-2 \pi i\langle x, \xi\rangle} d x \\
& =1+\int_{\mathbb{R}^{n}} \Phi(x) \frac{1}{2}(-2 \pi i\langle x, \xi\rangle)^{2} d x+O\left(|\xi|^{3}\right) \\
& =1-2 \pi^{2} \int_{\mathbb{R}^{n}} \Phi(x)\left(\sum_{j=1}^{n} x_{j}^{2} \xi_{j}^{2}\right) d x+O\left(|\xi|^{3}\right) \\
& =1-2 \pi^{2} b_{0}|\xi|^{2}+O\left(|\xi|^{3}\right),
\end{aligned}
$$

as $|\xi| \rightarrow 0$. Thus, since $c_{0}=b_{0} / 2$, we have $|\hat{\psi}(\xi)| \leq C|\xi|$ and hence (1.1). Altogether, thus we can apply Theorem A to get the conclusion of Theorem 1.1.

Similarly, Theorem 1.2 follows from Theorem B.
Define $\mathcal{L}=-\Delta=-\sum_{j=1}^{n} \partial_{j}^{2}, \partial_{j}=\partial / \partial x_{j}$, on $\mathbb{R}^{n}, n \geq 1$. Then, if $f \in \mathcal{S}\left(\mathbb{R}^{n}\right)$,

$$
\widehat{\mathcal{L}(f)}(\xi)=(2 \pi|\xi|)^{2} \hat{f}(\xi)
$$

where we have denoted by $\mathcal{S}\left(\mathbb{R}^{n}\right)$ the Schwartz class of rapidly decreasing smooth functions on $\mathbb{R}^{n}$. We note the following.

Lemma 1.3. Let $n \geq 1$. Define $H_{0}$ on $\mathcal{S}\left(\mathbb{R}^{n}\right)$ by $H_{0}(f)=\mathcal{L}\left(J_{2}(f)\right)$. Then $H_{0}$ extends to a bounded operator on $L_{w}^{p}$ and also we have $H_{0}(f)=\mathcal{L}\left(J_{2}(f)\right)$ for $f \in L_{w}^{p}$, where $\mathcal{L}=-\Delta=-\sum_{j=1}^{n} \partial_{j}^{2}$ is defined by the weak derivative:

$$
\int_{\mathbb{R}^{n}} H_{0}(f)(x) \eta(x) d x=\int_{\mathbb{R}^{n}} J_{2}(f)(x) \mathcal{L}(\eta)(x) d x=-\int_{\mathbb{R}^{n}} J_{2}(f)(x) \sum_{j=1}^{n} \partial_{j}^{2} \eta(x) d x
$$

for all $\eta \in \mathcal{S}\left(\mathbb{R}^{n}\right)$.
We shall give a proof of Lemma 1.3 in Section 2.
Let $\Phi \in \mathcal{M}^{1}\left(\mathbb{R}^{n}\right)$. Let

$$
\begin{equation*}
S(f)(x)=\left(\int_{0}^{\infty}\left|f * \Phi_{t}(x)-f(x)+c_{0} t^{2} \mathcal{L}(f) * \Phi_{t}(x)\right|^{2} \frac{d t}{t^{5}}\right)^{1 / 2} \tag{1.12}
\end{equation*}
$$

when $f, \mathcal{L}(f) \in L_{w}^{p}$, where $c_{0}$ is as in (1.10). For $g \in L_{w}^{p}$ let $H_{0}(g)$ be as in Lemma 1.3 and define

$$
\begin{equation*}
S_{2}(g)(x)=\left(\int_{0}^{\infty}\left|J_{2}(g) * \Phi_{t}(x)-J_{2}(g)(x)+c_{0} t^{2} H_{0}(g) * \Phi_{t}(x)\right|^{2} \frac{d t}{t^{5}}\right)^{1 / 2} \tag{1.13}
\end{equation*}
$$

Then $S\left(J_{2}(g)\right)=S_{2}(g)$ for $g \in L_{w}^{p}$ by Lemma 1.3. Let

$$
\begin{equation*}
S(f, g)(x)=\left(\int_{0}^{\infty}\left|f * \Phi_{t}(x)-f(x)+c_{0} t^{2} g * \Phi_{t}(x)\right|^{2} \frac{d t}{t^{5}}\right)^{1 / 2} \tag{1.14}
\end{equation*}
$$

for $f, g \in L_{w}^{p}$. Then, if $f, \mathcal{L}(f) \in L_{w}^{p}$, we have $S(f, \mathcal{L}(f))=S(f)$.
The square function $S(f, g)$ is able to characterize the space $W_{w}^{2, p}$ as follows.
Theorem 1.4. Let $n \geq 1$. Suppose that $f \in L_{w}^{p}, 1<p<\infty, w \in A_{p}$. Let $S(f)$, $S(f, g)$ be as in (1.12), (1.14), respectively, with $\Phi \in \mathcal{M}^{1}\left(\mathbb{R}^{n}\right)$ satisfying (1.7), (1.8) and (1.2), where $\Phi$ and $\psi$ are related as in (1.10), (4.4) or (5.5) according as $n \geq 3$, $n=2$ or $n=1$. Then
(1) if $f \in W_{w}^{2, p}$, then $\mathcal{L}(f) \in L_{w}^{p}$ and $S(f) \in L_{w}^{p}$;
(2) if $S(f, g) \in L_{w}^{p}$ for some $g \in L_{w}^{p}$, then $f \in W_{w}^{2, p}$ and $g=\mathcal{L}(f)$.

Also, if $f \in W_{w}^{2, p}$,

$$
\|S(f)\|_{p, w} \simeq\|\mathcal{L}(f)\|_{p, w}, \quad\|S(f)\|_{p, w}+\|f\|_{p, w} \simeq\|f\|_{p, 2, w}
$$

We can also consider discrete parameter version of Theorem 1.4. Let $\Phi \in \mathcal{M}^{1}\left(\mathbb{R}^{n}\right)$ and

$$
\begin{equation*}
V(f)(x)=\left(\sum_{k=-\infty}^{\infty}\left|f * \Phi_{2^{k}}(x)-f(x)+c_{0} 2^{2 k} \mathcal{L}(f) * \Phi_{2^{k}}(x)\right|^{2} 2^{-4 k}\right)^{1 / 2} \tag{1.15}
\end{equation*}
$$

if $f, \mathcal{L}(f) \in L_{w}^{p}$. Let

$$
\begin{equation*}
V_{2}(g)(x)=\left(\sum_{k=-\infty}^{\infty}\left|J_{2}(g) * \Phi_{2^{k}}(x)-J_{2}(g)(x)+c_{0} 2^{2 k} H_{0}(g) * \Phi_{2^{k}}(x)\right|^{2} 2^{-4 k}\right)^{1 / 2} \tag{1.16}
\end{equation*}
$$

for $g \in L_{w}^{p}$. If $g \in L_{w}^{p}$, we have $V\left(J_{2}(g)\right)=V_{2}(g)$ by Lemma 1.3. For $f, g \in L_{w}^{p}$, let

$$
\begin{equation*}
V(f, g)(x)=\left(\sum_{k=-\infty}^{\infty}\left|f * \Phi_{2^{k}}(x)-f(x)+c_{0} 2^{2 k} g * \Phi_{2^{k}}(x)\right|^{2} 2^{-4 k}\right)^{1 / 2} \tag{1.17}
\end{equation*}
$$

We have $V(f, \mathcal{L}(f))=V(f)$ if $f, \mathcal{L}(f) \in L_{w}^{p}$.
We have a discrete parameter analogue of Theorem 1.4.
Theorem 1.5. Suppose that $n \geq 1$ and $f \in L_{w}^{p}, 1<p<\infty, w \in A_{p}$. Let $\Phi$ be a function in $\mathcal{M}^{1}\left(\mathbb{R}^{n}\right)$ satisfying (1.7), (1.8), (1.11) and (1.3), where $\Phi$ and $\psi$ are related as in Theorem 1.4. Let $V(f)$ and $V(f, g)$ be as in (1.15) and (1.17), respectively. Then
(1) $\mathcal{L}(f) \in L_{w}^{p}$ and $V(f) \in L_{w}^{p}$ if $f \in W_{w}^{2, p}$;
(2) if $V(f, g) \in L_{w}^{p}$ for some $g \in L_{w}^{p}$, it follows that $f \in W_{w}^{2, p}$ and $g=\mathcal{L}(f)$.

Further, if $f \in W_{w}^{2, p}$,

$$
\|V(f)\|_{p, w} \simeq\|\mathcal{L}(f)\|_{p, w}, \quad\|V(f)\|_{p, w}+\|f\|_{p, w} \simeq\|f\|_{p, 2, w}
$$

See [2] for characterization of the Sobolev spaces by square functions related to the Lusin area integral and the Littlewood-Paley $g_{\lambda}^{*}$ function.

Let $\Phi$ be a function in $\mathcal{M}^{1}\left(\mathbb{R}^{n}\right)$ satisfying (1.7) and (1.8), then we have already seen in the proof of Theorem 1.1 that the function $\psi$ defined by (1.10), $n \geq 3$, satisfies the conditions (1.1) and (1), (2), (3) of Theorem A. This is also the case for functions $\psi$ in (4.4) and in (5.5) below, on $\mathbb{R}^{2}$ and on $\mathbb{R}$, respectively, as can be shown similarly.

Let us further assume that $\Phi$ is a radial function. Then, we have the decay estimate (1.11) by the formula in [13, p.155, Theorem 3.3] for $n \geq 2$. Also, if $\Phi$ is a radial function, it follows that $\psi$ defined by (1.10) satisfies the non-degeneracy condition (1.3) and hence (1.2). This is also the case for functions $\psi$ in (4.4) and (5.5).

We can see (1.3) when $\Phi$ is a radial function as follows. First, we note that there exists an entire function $G(z)=\sum_{k=1}^{\infty} a_{k} z^{k}$ such that $\hat{\psi}(\xi)=G(|\xi|)$. We can see that $\psi$ is not identically 0 . This holds since $\psi$ is unbounded when $n \geq 2$; the result for $n=1$ is also seen by an inspection (see Section 5). Therefore we have (1.3) since $z=0$ cannot be an accumulation point of zeros of $G(z)$.

If $\Phi=|B(0,1)|^{-1} \chi_{B(0,1)}$, then $\Phi \in \mathcal{M}^{1}\left(\mathbb{R}^{n}\right)$ and $\Phi$ satisfies (1.7) with $b_{0}=2 c_{0}=$ $1 /(n+2)$, (1.8), (1.11) and (1.3) with $\psi$ as in (1.10), (4.4) and (5.5), for all $n \geq 1$. This follows from remarks above and easy observations. In this case we can rewrite $S(f), S(f, g)$ and $V(f), V(f, g)$ as follows.

$$
\begin{gathered}
S(f)(x)^{2}=\int_{0}^{\infty}\left|f_{B(x, t)}\left(f(y)-f(x)-\frac{1}{2 n}(\Delta f)_{B(x, t)}|y-x|^{2}\right) d y\right|^{2} \frac{d t}{t^{5}} \\
S(f, g)(x)^{2}=\int_{0}^{\infty}\left|f_{B(x, t)}\left(f(y)-f(x)+\frac{1}{2 n} g_{B(x, t)}|y-x|^{2}\right) d y\right|^{2} \frac{d t}{t^{5}} \\
V(f)(x)^{2}=\sum_{k=-\infty}^{\infty}\left|f_{B\left(x, 2^{k}\right)}\left(f(y)-f(x)-\frac{1}{2 n}(\Delta f)_{B\left(x, 2^{k}\right)}|y-x|^{2}\right) d y\right|^{2} 2^{-4 k} \\
V(f, g)(x)^{2}=\sum_{k=-\infty}^{\infty}\left|f_{B\left(x, 2^{k}\right)}\left(f(y)-f(x)+\frac{1}{2 n} g_{B\left(x, 2^{k}\right)}|y-x|^{2}\right) d y\right|^{2} 2^{-4 k}
\end{gathered}
$$

where $f_{B}=f_{B} f$. The square functions $S(f), S(f, g)$ are considered in [1] and unweighted results concerning them contained in Theorem 1.4 are due to [1].

In Section 2, we shall prove Lemma 1.3 and Theorem 1.4 for $n \geq 3$ by applying Theorem 1.1. Theorem 1.5 can be proved in the same way as Theorem 1.4, by using Theorem 1.2 if $n \geq 3$. We shall give an outline of the proof of Theorem 1.5 for $n \geq 3$ in Section 3 .

To prove Theorems 1.4 and 1.5 for $n=1,2$, we need analogues of Theorems 1.1 and 1.2. The cases $n=1,2$ should be treated separately, since the Riesz potential is not available as in the case of $\mathbb{R}^{n}$ above for $n \geq 3$. In Section 4, in the two dimensional case, Theorems 1.4 and 1.5 will be proved, where analogues of Theorems 1.1 and 1.2 will be shown for $n=2$. Finally, in Section 5, we shall prove

Theorems 1.4 and 1.5 for $n=1$. Also, analogues of Theorems 1.1 and 1.2 for $n=1$ will be given.

## 2. Proof of Theorem 1.4 for $n \geq 3$

We need the following.
Lemma 2.1. Let $S$ and $S_{2}$ be as in (1.12) and (1.13), respectively, on $\mathbb{R}^{n}, n \geq 1$, with $\Phi$ as in Theorem 1.4. Let $g \in L_{w}^{p}, w \in A_{p}, 1<p<\infty$. Then

$$
\begin{equation*}
\left\|S\left(J_{2}(g)\right)\right\|_{p, w}+\left\|J_{2}(g)\right\|_{p, w}=\left\|S_{2}(g)\right\|_{p, w}+\left\|J_{2}(g)\right\|_{p, w} \simeq\|g\|_{p, w} \tag{2.1}
\end{equation*}
$$

We give a proof of Lemma 2.1 for $n \geq 3$ in this section. The results for $n=2$ and $n=1$ can be shown similarly with the arguments in Sections 4 and 5 , respectively.

The following relations concerning Riesz and Bessel potentials are useful.
Lemma 2.2. Let $\alpha>0$. Suppose that $1<p<\infty$ and $w$ is a weight in $A_{p}$ on $\mathbb{R}^{n}$, $n \geq 1$.
(1) We can find a Fourier multiplier $\ell$ for $L_{w}^{p}$ such that

$$
(2 \pi|\xi|)^{\alpha}=\ell(\xi)\left(1+4 \pi^{2}|\xi|^{2}\right)^{\alpha / 2}
$$

(2) We have

$$
\left(1+4 \pi^{2}|\xi|^{2}\right)^{\alpha / 2}=m(\xi)+m(\xi)(2 \pi|\xi|)^{\alpha}
$$

with some Fourier multiplier $m$ for $L_{w}^{p}$.
Here we give a proof of Lemma 1.3.
Proof of Lemma 1.3 . By part (1) of Lemma 2.2, we see that $H_{0}$ initially defined on $\mathcal{S}\left(\mathbb{R}^{n}\right)$ extends to a bounded operator on $L_{w}^{p}$ and integration by parts implies

$$
\int_{\mathbb{R}^{n}} H_{0}(f)(x) \eta(x) d x=-\int_{\mathbb{R}^{n}} J_{2}(f)(x) \sum_{j=1}^{n} \partial_{j}^{2} \eta(x) d x
$$

for all $\eta \in \mathcal{S}\left(\mathbb{R}^{n}\right)$ if $f \in \mathcal{S}\left(\mathbb{R}^{n}\right)$. Since both sides of the equality above are continuous in $f \in L_{w}^{p}$ for each fixed $\eta$ and $\mathcal{S}\left(\mathbb{R}^{n}\right)$ is dense in $L_{w}^{p}$, we get the conclusion.

Proof of Lemma 2.1 for $n \geq 3$. We first prove (2.1) for $g \in \mathcal{S}\left(\mathbb{R}^{n}\right)$. We can write

$$
S_{2}(g)=g_{\psi}\left(H_{0}(g)\right)
$$

Thus Theorem 1.1 implies

$$
\begin{equation*}
\left\|S_{2}(g)\right\|_{p, w}=\left\|g_{\psi}\left(H_{0}(g)\right)\right\|_{p, w} \simeq\left\|H_{0}(g)\right\|_{p, w} \leq C\|g\|_{p, w} \tag{2.2}
\end{equation*}
$$

Also, by part (2) of Lemma 2.2 and Theorem 1.1

$$
\begin{align*}
\|g\|_{p, w} & =\left\|J_{-2} J_{2}(g)\right\|_{p, w} \leq C\left\|J_{2}(g)\right\|_{p, w}+C\left\|\mathcal{L} J_{2}(g)\right\|_{p, w}  \tag{2.3}\\
& \leq C\left\|J_{2}(g)\right\|_{p, w}+C\left\|S_{2}(g)\right\|_{p, w}
\end{align*}
$$

From (2.2) and (2.3), (2.1) follows for $g \in \mathcal{S}\left(\mathbb{R}^{n}\right)$.
Let

$$
S_{2}^{N}(g)(x)=\left(\int_{N^{-1}}^{N}\left|J_{2}(g) * \Phi_{t}(x)-J_{2}(g)(x)+c_{0} t^{2} H_{0}(g) * \Phi_{t}(x)\right|^{2} \frac{d t}{t^{5}}\right)^{1 / 2}
$$

Then $\left\|S_{2}^{N}(g)\right\|_{p, w} \leq C_{N}\|g\|_{p, w}$ for $g \in L_{w}^{p}$. Using this and (2.1) for $g \in \mathcal{S}\left(\mathbb{R}^{n}\right)$, we have $\left\|S_{2}^{N}(g)\right\|_{p, w} \leq C\|g\|_{p, w}$ for $g \in L_{w}^{p}$ with a constant $C$ independent of $N$, since $\mathcal{S}\left(\mathbb{R}^{n}\right)$ is dense in $L_{w}^{p}$. Thus, letting $N \rightarrow \infty$, we have $\left\|S_{2}(g)\right\|_{p, w} \leq C\|g\|_{p, w}$ for $g \in L_{w}^{p}$. We can take a sequence $\left\{g_{k}\right\}$ in $\mathcal{S}\left(\mathbb{R}^{n}\right)$ such that $g_{k} \rightarrow g$ in $L_{w}^{p}$ and $J_{2}\left(g_{k}\right) \rightarrow J_{2}(g)$ in $L_{w}^{p}$ as $k \rightarrow \infty$. Then we note that $\left\|S_{2}\left(g_{k}\right)\right\|_{p, w} \rightarrow\left\|S_{2}(g)\right\|_{p, w}$. Thus, letting $k \rightarrow \infty$ in the relation

$$
\left\|S_{2}\left(g_{k}\right)\right\|_{p, w}+\left\|J_{2}\left(g_{k}\right)\right\|_{p, w} \simeq\left\|g_{k}\right\|_{p, w}
$$

which has been already shown, we get the conclusion.
The next result will be useful in what follows (see [11] for a proof).
Lemma 2.3. Suppose that $f$ is in $L_{w}^{p}$ on $\mathbb{R}^{n}$, $n \geq 1$, with $w \in A_{p}, 1<p<\infty$. Let $g \in \mathcal{S}\left(\mathbb{R}^{n}\right)$ and $\alpha>0$. Then we have
(1) $K_{\alpha} *(f * g)(x)=\left(K_{\alpha} * f\right) * g(x)=\left(K_{\alpha} * g\right) * f(x)$ for every $x \in \mathbb{R}^{n}$;
(2) $\int_{\mathbb{R}^{n}}\left(K_{\alpha} * f\right)(y) g(y) d y=\int_{\mathbb{R}^{n}}\left(K_{\alpha} * g\right)(y) f(y) d y$.

Proof of Theorem 1.4 for $n \geq 3$. If $f \in W_{w}^{2, p}, f=J_{2}(g)$ for some $g \in L_{w}^{p}$. Thus by Lemma 1.3 and Lemma 2.1 we have part (1).

Suppose $f, g, S(f, g) \in L_{w}^{p}$. Let $\varphi \in C_{0}^{\infty}\left(\mathbb{R}^{n}\right)$ with $\int \varphi=1$ and put $f^{\epsilon}=f * \varphi_{\epsilon}$, $g^{\epsilon}=g * \varphi_{\epsilon}, h^{\epsilon}=f * J_{-2}\left(\varphi_{\epsilon}\right)$. We note that $f^{\epsilon}=J_{2}\left(h^{\epsilon}\right)$ by Lemma $2.3, f^{\epsilon}, g^{\epsilon}, h^{\epsilon} \in L_{w}^{p}$ and $\mathcal{L}\left(f^{\epsilon}\right)=H_{0}\left(h^{\epsilon}\right)$ by Lemma 1.3. Also, $g^{\epsilon} \rightarrow g, f^{\epsilon} \rightarrow f$ in $L_{w}^{p}$.

By Minkowski's inequality we have

$$
\begin{equation*}
S\left(f^{\epsilon}, g^{\epsilon}\right)(x) \leq C M(S(f, g))(x) \tag{2.4}
\end{equation*}
$$

Thus, since

$$
\left(\int_{0}^{\infty}\left|c_{0} H_{0}\left(h^{\epsilon}\right) * \Phi_{t}(x)-c_{0} g^{\epsilon} * \Phi_{t}(x)\right|^{2} \frac{d t}{t}\right)^{1 / 2} \leq S_{2}\left(h^{\epsilon}\right)(x)+S\left(f^{\epsilon}, g^{\epsilon}\right)(x)
$$

we see that the quantity on the left hand side belongs to $L_{w}^{p}$ by (2.4) and Lemma 2.1. Thus

$$
0=\lim _{t \rightarrow 0}\left|H_{0}\left(h^{\epsilon}\right) * \Phi_{t}(x)-g^{\epsilon} * \Phi_{t}(x)\right|=\left|H_{0}\left(h^{\epsilon}\right)(x)-g^{\epsilon}(x)\right|
$$

which implies

$$
\begin{gather*}
H_{0}\left(h^{\epsilon}\right)(x)=g^{\epsilon}(x),  \tag{2.5}\\
S_{2}\left(h^{\epsilon}\right)(x)=S\left(f^{\epsilon}, g^{\epsilon}\right)(x),
\end{gather*}
$$

for almost every $x \in \mathbb{R}^{n}$, and hence

$$
\left\|S_{2}\left(h^{\epsilon}\right)\right\|_{p, w} \leq C
$$

with a constant $C$ independent of $\epsilon>0$ by (2.4). Thus we have $\left\|h^{\epsilon}\right\|_{p, w} \simeq\left\|f^{\epsilon}\right\|_{p, w}+$ $\left\|S_{2}\left(h^{\epsilon}\right)\right\|_{p, w} \leq C$ by Lemma 2.1.

So, we have a sequence $\left\{h^{\epsilon_{k}}\right\}$ and $h \in L_{w}^{p}$ such that $h^{\epsilon_{k}} \rightarrow h$ weakly in $L_{w}^{p}$. For $\eta \in \mathcal{S}\left(\mathbb{R}^{n}\right)$, by (2.5), Lemma 1.3 and Lemma 2.3 we have

$$
\begin{aligned}
\int_{\mathbb{R}^{n}} H_{0}(h) \eta d x & =\int_{\mathbb{R}^{n}} J_{2}(h) \mathcal{L}(\eta) d x=\int_{\mathbb{R}^{n}} h J_{2}(\mathcal{L}(\eta)) d x \\
& =\lim _{k} \int_{\mathbb{R}^{n}} h^{\epsilon_{k}} J_{2}(\mathcal{L}(\eta)) d x=\lim _{k} \int_{\mathbb{R}^{n}} J_{2}\left(h^{\epsilon_{k}}\right) \mathcal{L}(\eta) d x
\end{aligned}
$$

$$
=\lim _{k} \int_{\mathbb{R}^{n}} H_{0}\left(h^{\epsilon_{k}}\right) \eta d x=\lim _{k} \int_{\mathbb{R}^{n}} g^{\epsilon_{k}} \eta d x=\int_{\mathbb{R}^{n}} g \eta d x
$$

Thus $H_{0}(h)=g$. Also,

$$
\int_{\mathbb{R}^{n}} H_{0}(h) \eta d x=\lim _{k} \int_{\mathbb{R}^{n}} J_{2}\left(h^{\epsilon_{k}}\right) \mathcal{L}(\eta) d x=\lim _{k} \int_{\mathbb{R}^{n}} f^{\epsilon_{k}} \mathcal{L}(\eta) d x=\int_{\mathbb{R}^{n}} f \mathcal{L}(\eta) d x
$$

So we have $H_{0}(h)=g=\mathcal{L}(f)$. Similarly, we see that $f=J_{2}(h)$. This proves part (2).

By (2.2)

$$
\begin{equation*}
\left\|S_{2}(g)\right\|_{p, w} \simeq\left\|H_{0}(g)\right\|_{p, w} \tag{2.6}
\end{equation*}
$$

for $g \in \mathcal{S}\left(\mathbb{R}^{n}\right)$. Since $S_{2}$ and $H_{0}$ are continuous on $L_{w}^{p}$ and $\mathcal{S}\left(\mathbb{R}^{n}\right)$ is dense in $L_{w}^{p}$, we have (2.6) for all $g \in L_{w}^{p}$. If $f \in W_{w}^{2, p}$ and $f=J_{2}(h)$ with $h \in L_{w}^{p}, H_{0}(h)=\mathcal{L}(f)$ by Lemma 1.3 and $\left\|S_{2}(h)\right\|_{p, w}=\|S(f)\|_{p, w} \simeq\|\mathcal{L}(f)\|_{p, w}$ from (2.6). Also, by Lemma 2.1, $\|S(f)\|_{p, w}+\|f\|_{p, w} \simeq\|h\|_{p, w}=\|f\|_{p, 2, w}$. This completes the proof of Theorem 1.4.

## 3. Proof of Theorem 1.5 for $n \geq 3$

We can prove Theorem 1.5 similarly to the proof of Theorem 1.4. So, only the outline of the proof is given.

Lemma 3.1. Let $V$ and $V_{2}$ be as in (1.15) and (1.16) on $\mathbb{R}^{n}, n \geq 1$, respectively, with $\Phi$ as in Theorem 1.5. Suppose that $g \in L_{w}^{p}, w \in A_{p}, 1<p<\infty$. Then

$$
\left\|V\left(J_{2}(g)\right)\right\|_{p, w}+\left\|J_{2}(g)\right\|_{p, w}=\left\|V_{2}(g)\right\|_{p, w}+\left\|J_{2}(g)\right\|_{p, w} \simeq\|g\|_{p, w}
$$

To prove Lemma 3.1 for $n \geq 3$ we note that

$$
V_{2}(g)=\Delta_{\psi}\left(H_{0}(g)\right)
$$

for $g \in \mathcal{S}\left(\mathbb{R}^{n}\right)$ and apply Theorem 1.2 and Lemma 2.2.
Lemma 1.3 and Lemma 3.1 imply part (1) of Theorem 1.5. To prove part (2) of Theorem 1.5, let $f, g, V(f, g) \in L_{w}^{p}$ and $f^{\epsilon}, g^{\epsilon}, h^{\epsilon}$ be as in the proof of Theorem 1.4. Then

$$
V\left(f^{\epsilon}, g^{\epsilon}\right)(x) \leq C M(V(f, g))(x)
$$

by Minkowski's inequality. Using this and

$$
\left(\sum_{k=-\infty}^{\infty}\left|c_{0} H_{0}\left(h^{\epsilon}\right) * \Phi_{2^{k}}(x)-c_{0} g^{\epsilon} * \Phi_{2^{k}}(x)\right|^{2}\right)^{1 / 2} \leq V_{2}\left(h^{\epsilon}\right)(x)+V\left(f^{\epsilon}, g^{\epsilon}\right)(x)
$$

we can proceed as in the proof of Theorem 1.4 to get the assertion of part (2).

## 4. Two dimensional case

We consider $L_{\alpha}(x)=\tau(\alpha)|x|^{\alpha-2}$ on $\mathbb{R}^{2}$. Then we have the following (see $[3, \mathrm{p}$. 151]).

Lemma 4.1. For $\varphi \in \mathcal{S}\left(\mathbb{R}^{2}\right)$ we have

$$
\begin{aligned}
& \left\langle-\frac{1}{2 \pi} \log \right| x|, \hat{\varphi}\rangle=\int_{\mathbb{R}^{2}}\left(-\frac{1}{2 \pi} \log |x|\right) \hat{\varphi}(x) d x=\lim _{\substack{\alpha \rightarrow 2 \\
\alpha<2}}\left\langle L_{\alpha}-\tau(\alpha), \hat{\varphi}\right\rangle \\
= & \int_{|\xi|<1}(2 \pi|\xi|)^{-2}(\varphi(\xi)-\varphi(0)) d \xi+\int_{|\xi| \geq 1}(2 \pi|\xi|)^{-2} \varphi(\xi) d \xi+\frac{1}{2 \pi} \varphi(0)\left(-\Gamma^{\prime}(1)+\log \pi\right) .
\end{aligned}
$$

It is known that $\Gamma^{\prime}(1)=-\gamma$, where $\gamma$ denotes Euler's constant.
Proof of Lemma 4.1. Let $\alpha \in(0,2)$. Then

$$
\int_{|\xi|<1}(2 \pi|\xi|)^{-\alpha} d \xi-\tau(\alpha)=\frac{(2 \pi)^{1-\alpha}}{2-\alpha}-\frac{\Gamma\left(1-\frac{1}{2} \alpha\right)}{\Gamma\left(\frac{1}{2} \alpha\right) 2^{\alpha} \pi}=(2 \pi)^{1-\alpha} \frac{G(2)-G(\alpha)}{2-\alpha}
$$

where

$$
G(\alpha)=\frac{\Gamma\left(2-\frac{1}{2} \alpha\right) \pi^{\alpha-2}}{\Gamma\left(\frac{1}{2} \alpha\right)}
$$

We note that
$G^{\prime}(\alpha)=\frac{-\frac{1}{2} \Gamma^{\prime}\left(2-\frac{1}{2} \alpha\right) \Gamma\left(\frac{1}{2} \alpha\right)-\frac{1}{2} \Gamma\left(2-\frac{1}{2} \alpha\right) \Gamma^{\prime}\left(\frac{1}{2} \alpha\right)}{\Gamma\left(\frac{1}{2} \alpha\right)^{2}} \pi^{\alpha-2}+\frac{\Gamma\left(2-\frac{1}{2} \alpha\right)}{\Gamma\left(\frac{1}{2} \alpha\right)} \pi^{\alpha-2} \log \pi$.
Thus

$$
\begin{equation*}
\int_{|\xi|<1}(2 \pi|\xi|)^{-\alpha} d \xi-\tau(\alpha) \rightarrow \frac{-\Gamma^{\prime}(1)+\log \pi}{2 \pi} \quad \text { as } \alpha \rightarrow 2 \text { with } \alpha<2 \tag{4.1}
\end{equation*}
$$

On the other hand,

$$
\begin{equation*}
L_{\alpha}(x)-\tau(\alpha)=\frac{2 \Gamma\left(2-\frac{1}{2} \alpha\right)}{\Gamma\left(\frac{1}{2} \alpha\right) 2^{\alpha} \pi} \frac{|x|^{\alpha-2}-1}{2-\alpha} \rightarrow-\frac{1}{2 \pi} \log |x| \quad \text { for } x \in \mathbb{R}^{2} \backslash\{0\} \tag{4.2}
\end{equation*}
$$

as $\alpha \rightarrow 2$ with $\alpha<2$. Also, if $\alpha \in(3 / 2,2)$,

$$
\begin{equation*}
\left|L_{\alpha}(x)-\tau(\alpha)\right| \leq C|x|^{-1} \chi_{B(0,2)}(x)+C|\log | x \| \chi_{\mathbb{R}^{2} \backslash B(0,2)}(x) \tag{4.3}
\end{equation*}
$$

with a constant $C$ independent of $\alpha$. By (4.1), (4.2), (4.3) and the Lebesgue convergence theorem we have

$$
\begin{aligned}
&\langle \left.-\frac{1}{2 \pi} \log |x|, \hat{\varphi}\right\rangle=\lim _{\substack{\alpha \rightarrow 2 \\
\alpha<2}}\left\langle L_{\alpha}-\tau(\alpha), \hat{\varphi}\right\rangle=\lim _{\substack{\alpha \rightarrow 2 \\
\alpha<2}}\left(\int_{\mathbb{R}^{2}}(2 \pi|\xi|)^{-\alpha} \varphi(\xi) d \xi-\tau(\alpha) \varphi(0)\right) \\
&=\lim _{\substack{\alpha \rightarrow 2 \\
\alpha<2}}\left[\int_{|\xi|<1}(2 \pi|\xi|)^{-\alpha}(\varphi(\xi)-\varphi(0)) d \xi+\int_{|\xi| \geq 1}(2 \pi|\xi|)^{-\alpha} \varphi(\xi) d \xi\right. \\
&\left.+\varphi(0)\left(\int_{|\xi|<1}(2 \pi|\xi|)^{-\alpha} d \xi-\tau(\alpha)\right)\right] \\
&= \int_{|\xi|<1}(2 \pi|\xi|)^{-2}(\varphi(\xi)-\varphi(0)) d \xi+\int_{|\xi| \geq 1}(2 \pi|\xi|)^{-2} \varphi(\xi) d \xi \\
&+\frac{1}{2 \pi} \varphi(0)\left(-\Gamma^{\prime}(1)+\log \pi\right)
\end{aligned}
$$

Lemma 4.2. Let $L_{2}(x)=-\frac{1}{2 \pi} \log |x|$ on $\mathbb{R}^{2}$. Let $\Phi \in \mathcal{M}^{1}\left(\mathbb{R}^{2}\right)$. Suppose that $\Phi$ satisfies (1.7), (1.8) and $\operatorname{supp} \Phi \subset\{|x| \leq M\}$. Let $\eta(x)=L_{2} * \Phi(x)-L_{2}(x)$. Then $|\eta(x)| \leq C(1+|\log | x| |)$ if $|x| \leq 2 M$ and $|\eta(x)| \leq C|x|^{-3}$ if $|x| \geq 2 M$. Also, $\hat{\eta}(\xi)=(2 \pi|\xi|)^{-2}(\hat{\Phi}(\xi)-1)$.
Proof. The estimates $|\eta(x)| \leq C(1+|\log | x| |)$ for $|x| \leq 2 M$ and $|\eta(x)| \leq C|x|^{-3}$ for $|x| \geq 2 M$ can be shown as in the proof of Theorem 1.1, since $\Delta L_{2}=0$ on $\mathbb{R}^{2} \backslash\{0\}$.

Let $\Psi \in C_{0}^{\infty}\left(\mathbb{R}^{2}\right)$ with $\Psi(0)=1$. Let $\varphi \in \mathcal{S}\left(\mathbb{R}^{2}\right)$ and $\varphi_{(\epsilon)}(\xi)=\varphi(\xi)-\varphi(0) \Psi(\xi / \epsilon)$. Then, since $\varphi_{(\epsilon)}$ belongs to $\mathcal{S}\left(\mathbb{R}^{2}\right)$ and vanishes at the origin, by Lemma 4.1 we have

$$
\begin{aligned}
& \left\langle\eta, \hat{\varphi}_{(\epsilon)}\right\rangle=\int_{\mathbb{R}^{2}}\left(-\frac{1}{2 \pi} \int_{\mathbb{R}^{2}} \log |x-y| \hat{\varphi}(\epsilon)(x) d x+\frac{1}{2 \pi} \int_{\mathbb{R}^{2}} \log |x| \hat{\varphi}(\epsilon)\right. \\
& \left.=\int_{\mathbb{R}^{2}}(x) d x\right) \Phi(y) d y \\
& \left.=\int_{\mathbb{R}^{2}}(2 \pi|\xi|)^{-2} \varphi_{(\epsilon)}(\xi)\left(e^{-2 \pi i\langle y, \xi\rangle}-1\right) d \xi\right) \Phi(y) d y \\
& =\int_{\mathbb{R}^{2}}(2 \pi|\xi|)^{-2} \varphi_{(\epsilon)}(\xi)(\hat{\Phi}(\xi)-1) d \xi \\
& =)^{-2} \varphi(\xi)(\hat{\Phi}(\xi)-1) d \xi-\varphi(0) \int_{\mathbb{R}^{2}}(2 \pi|\xi|)^{-2} \Psi(\xi / \epsilon)(\hat{\Phi}(\xi)-1) d \xi
\end{aligned}
$$

Since $\Phi \in \mathcal{M}^{1}\left(\mathbb{R}^{2}\right)$, we can see that the last integral tends to 0 as $\epsilon \rightarrow 0$. Also, $\left\langle\eta, \hat{\varphi}_{(\epsilon)}\right\rangle=\langle\eta, \hat{\varphi}\rangle-\varphi(0)\left\langle\eta,(\hat{\Psi})_{\epsilon^{-1}}\right\rangle$ and $\left\langle\eta,(\hat{\Psi})_{\epsilon^{-1}}\right\rangle \rightarrow 0$ as $\epsilon \rightarrow 0$. Collecting results we get

$$
\langle\eta, \hat{\varphi}\rangle=\int_{\mathbb{R}^{2}}(2 \pi|\xi|)^{-2} \varphi(\xi)(\hat{\Phi}(\xi)-1) d \xi
$$

which implies $\hat{\eta}(\xi)=(2 \pi|\xi|)^{-2}(\hat{\Phi}(\xi)-1)$.
Let

$$
\begin{equation*}
\psi(x)=\Phi * L_{2}(x)-L_{2}(x)+c_{0} \Phi(x) \tag{4.4}
\end{equation*}
$$

where $\Phi \in \mathcal{M}^{1}\left(\mathbb{R}^{2}\right)$ satisfying (1.7) and (1.8) and $c_{0}=b_{0} / 2$. Then, by the proof of Theorem 1.1 for $n \geq 3$ and Lemma 4.2, we can see that $\psi$ satisfies (1.1) and (1), (2), (3) of Theorem A. Thus we have the following.

Theorem 4.3. Let $\psi$ be as in (4.4). Suppose the condition (1.2) holds. Then

$$
\|f\|_{p, w} \simeq\left\|g_{\psi}(f)\right\|_{p, w}, \quad f \in L_{w}^{p}\left(\mathbb{R}^{2}\right)
$$

If $\psi$ is as in (4.4), then by Lemma 4.2 we see that $S_{2}(g)=g_{\psi}\left(H_{0}(g)\right)$ for $g \in \mathcal{S}\left(\mathbb{R}^{2}\right)$. Using this and Theorem 4.3, we can argue similarly to the proof of Theorem 1.4 for $n \geq 3$, so that we see that Theorem 1.4 holds in the case of $\mathbb{R}^{2}$.

Also, Theorem B implies the following.
Theorem 4.4. Let $\psi$ be as in (4.4). Suppose the conditions (1.11) and (1.3) hold. Then

$$
\|f\|_{p, w} \simeq\left\|\Delta_{\psi}(f)\right\|_{p, w}, \quad f \in L_{w}^{p}\left(\mathbb{R}^{2}\right)
$$

Lemma 4.2 implies that $V_{2}(g)=\Delta_{\psi}\left(H_{0}(g)\right), g \in \mathcal{S}\left(\mathbb{R}^{2}\right)$. From this and Theorem 4.4 we can see that Theorem 1.5 is valid in the case of $\mathbb{R}^{2}$ by arguing similarly to the proof of Theorem 1.5 for $n \geq 3$.

## 5. One dimensional Case

We recall the following result (see [5]).
Lemma 5.1. Let $1<\alpha \leq 2, \varphi \in \mathcal{S}(\mathbb{R})$. Then

$$
\int_{-\infty}^{\infty}|x|^{\alpha-1} \hat{\varphi}(x) d x=\frac{1-\alpha}{2} \pi^{-\alpha+1 / 2} \frac{\Gamma\left(\frac{\alpha}{2}\right)}{\Gamma\left(\frac{3-\alpha}{2}\right)} \int_{0}^{\infty} \frac{\varphi(\xi)+\varphi(-\xi)-2 \varphi(0)}{\xi^{\alpha}} d \xi
$$

We give a proof for completeness.
Proof of Lemma 5.1. We prove the lemma when $1<\alpha<2$. The case $\alpha=2$ follows from this by taking the limit as $\alpha \rightarrow 2$ with $\alpha<2$.

We write

$$
\begin{equation*}
\int_{-\infty}^{\infty}|x|^{\alpha-1} \hat{\varphi}(x) d x=\lim _{M \rightarrow \infty} \int_{-M}^{M}|x|^{\alpha-1} \hat{\varphi}(x) d x \tag{5.1}
\end{equation*}
$$

Now, integration by parts implies

$$
\begin{aligned}
\int_{-M}^{M}|x|^{\alpha-1} e^{-2 \pi i\langle x, \xi\rangle} d x & =2 \int_{0}^{M} x^{\alpha-1} \cos (2 \pi x \xi) d x \\
& =\int_{0}^{M} \Theta(\xi, x, M)(\alpha-1) x^{\alpha-2} d x
\end{aligned}
$$

where

$$
\Theta(\xi, x, M)=\frac{\sin (2 \pi M \xi)}{\pi \xi}-\frac{\sin (2 \pi x \xi)}{\pi \xi}
$$

Thus

$$
\begin{aligned}
\int_{-M}^{M}|x|^{\alpha-1} \hat{\varphi}(x) d x & =\int_{0}^{\infty} \int_{0}^{M} \Theta(\xi, x, M)(\varphi(\xi)+\varphi(-\xi))(\alpha-1) x^{\alpha-2} d x d \xi \\
& =\lim _{L \rightarrow \infty} \int_{0}^{L} \int_{0}^{M} \Theta(\xi, x, M)(\varphi(\xi)+\varphi(-\xi))(\alpha-1) x^{\alpha-2} d x d \xi
\end{aligned}
$$

Let $\Psi(\xi)=\varphi(\xi)+\varphi(-\xi)-2 \varphi(0)$. Then we have

$$
\begin{aligned}
& \int_{0}^{L} \int_{0}^{M} \Theta(\xi, x, M)(\varphi(\xi)+\varphi(-\xi)) x^{\alpha-2} d x d \xi \\
& =\int_{0}^{L} \int_{0}^{M} \Theta(\xi, x, M) \Psi(\xi) x^{\alpha-2} d x d \xi+2 \varphi(0) \int_{0}^{L} \int_{0}^{M} \Theta(\xi, x, M) x^{\alpha-2} d x d \xi
\end{aligned}
$$

We easily see that the last integral tends to 0 as $L \rightarrow \infty$, since

$$
\int_{0}^{L} \frac{\sin (2 \pi A \xi)}{\xi} d \xi \rightarrow \frac{\pi}{2} \quad \text { boundedly in } A>0
$$

Therefore

$$
\begin{equation*}
\int_{-M}^{M}|x|^{\alpha-1} \hat{\varphi}(x) d x=\lim _{L \rightarrow \infty} \int_{0}^{L} \int_{0}^{M} \Theta(\xi, x, M) \Psi(\xi)(\alpha-1) x^{\alpha-2} d x d \xi \tag{5.2}
\end{equation*}
$$

By integration,

$$
\int_{0}^{L} \int_{0}^{M} \frac{\sin (2 \pi M \xi)}{\pi \xi} \Psi(\xi)(\alpha-1) x^{\alpha-2} d x d \xi=M^{\alpha-1} \int_{0}^{L} \frac{\sin (2 \pi M \xi)}{\pi \xi} \Psi(\xi) d \xi
$$

Applying integration by parts, we have

$$
\begin{aligned}
& M^{\alpha-1} \int_{0}^{L} \frac{\sin (2 \pi M \xi)}{\pi \xi} \Psi(\xi) d \xi \\
= & -2^{-1} \pi^{-2} M^{\alpha-2} \cos (2 \pi M L) \Psi(L) / L+2^{-1} \pi^{-2} M^{\alpha-2} \int_{0}^{L} \cos (2 \pi M \xi)(\Psi(\xi) / \xi)^{\prime} d \xi
\end{aligned}
$$

We observe that $(\Psi(\xi) / \xi)^{\prime} \in L^{1}(\mathbb{R})$. Thus

$$
\begin{align*}
\lim _{L \rightarrow \infty} \int_{0}^{L} \int_{0}^{M} \frac{\sin (2 \pi M \xi)}{\pi \xi} \Psi(\xi) & (\alpha-1) x^{\alpha-2} d x d \xi  \tag{5.3}\\
& =2^{-1} \pi^{-2} M^{\alpha-2} \int_{0}^{\infty} \cos (2 \pi M \xi)(\Psi(\xi) / \xi)^{\prime} d \xi
\end{align*}
$$

We note that the last integral tends to 0 as $M \rightarrow \infty$. On the other hand, since $\Psi(\xi) \xi^{-\alpha}$ is integrable on the interval $(0, \infty)$, by a change of variables we have

$$
\begin{align*}
\lim _{L \rightarrow \infty} \int_{0}^{L} \int_{0}^{M} \frac{\sin (2 \pi x \xi)}{\pi \xi} \Psi(\xi) & (\alpha-1) x^{\alpha-2} d x d \xi  \tag{5.4}\\
& =\int_{0}^{\infty} \frac{\Psi(\xi)}{\pi \xi^{\alpha}} \int_{0}^{M \xi}(\alpha-1) x^{\alpha-2} \sin (2 \pi x) d x d \xi
\end{align*}
$$

Here we note that the limit

$$
\lim _{M \rightarrow \infty} \int_{0}^{M}(\alpha-1) x^{\alpha-2} \sin (2 \pi x) d x
$$

exists when $1<\alpha<2$. By (5.2), (5.3) and (5.4), we see that

$$
\lim _{M \rightarrow \infty} \int_{-M}^{M}|x|^{\alpha-1} \hat{\varphi}(x) d x=-(\alpha-1) 2^{-\alpha+1} \pi^{-\alpha} \int_{0}^{\infty} x^{\alpha-2} \sin x d x \int_{0}^{\infty} \frac{\Psi(\xi)}{\xi^{\alpha}} d \xi
$$

By (5.1) and a formula for the value of the integral $\int_{0}^{\infty} x^{\alpha-2} \sin x d x$ (see [14, p. 182]), we get the conclusion.

Remark 5.2. We note that

$$
\frac{1-\alpha}{2} \pi^{-\alpha+1 / 2} \frac{\Gamma\left(\frac{\alpha}{2}\right)}{\Gamma\left(\frac{3-\alpha}{2}\right)}=2(2 \pi)^{-\alpha} \Gamma(\alpha) \cos \left(\frac{\alpha \pi}{2}\right)
$$

in Lemma 5.1.
We can prove the following.
Lemma 5.3. Let $L_{2}(x)=-\frac{1}{2}|x|$ on $\mathbb{R}^{1}$. Suppose $\Phi \in \mathcal{M}^{1}\left(\mathbb{R}^{1}\right)$ and $\operatorname{supp} \Phi \subset\{|x| \leq$ $M\}$. Let $\eta(x)=L_{2} * \Phi(x)-L_{2}(x)$. Then $|\eta(x)| \leq C$ if $|x| \leq 2 M$ and $\eta(x)=0$ if $|x| \geq 2 M$. Also, $\hat{\eta}(\xi)=(2 \pi|\xi|)^{-2}(\hat{\Phi}(\xi)-1)$.

The equation $\hat{\eta}(\xi)=(2 \pi|\xi|)^{-2}(\hat{\Phi}(\xi)-1)$ follows from Lemma 5.1 with $\alpha=2$ as in Lemma 4.2. The other assertions of Lemma 5.3 can be shown easily.

Let

$$
\begin{equation*}
\psi(x)=\Phi * L_{2}(x)-L_{2}(x)+c_{0} \Phi(x) \tag{5.5}
\end{equation*}
$$

where $\Phi \in \mathcal{M}^{1}\left(\mathbb{R}^{1}\right)$ and $c_{0}=b_{0} / 2$ with $b_{0}$ as in (1.7). Then, the conditions (1.1) and (1), (2), (3) of Theorem A follow from the proof of Theorem 1.1 for $n \geq 3$ and Lemma 5.3.

We have the following.
Theorem 5.4. Let $\psi$ be as in (5.5). Then

$$
\|f\|_{p, w} \simeq\left\|g_{\psi}(f)\right\|_{p, w}, \quad f \in L_{w}^{p}(\mathbb{R})
$$

To see this from Theorem A, it suffices to show that (1.3) holds for $\psi$ of (5.5). The proof is similar to the one given in Section 1 when $\Phi$ is a radial function. So, it suffices to show that $\psi$ is not identically 0 . We prove it by contradiction. Suppose that $\psi$ is identically 0 . Then,

$$
\hat{\Phi}(\xi)\left(1+c_{0}(2 \pi|\xi|)^{2}\right)=1
$$

Since $\hat{\Phi}$ is bounded and is not a constant function, we deduce that $c_{0}>0$. It follows that

$$
\hat{\Phi}\left((2 \pi)^{-1} c_{0}^{-1 / 2} \xi\right)=\frac{1}{1+\xi^{2}}
$$

which is the Fourier transform of the function $\pi e^{-2 \pi|x|}$. This contradicts the fact that $\Phi$ is compactly supported.

Let $\psi$ be as in (5.5). Then it follows by Lemma 5.3 that $S_{2}(g)=g_{\psi}\left(H_{0}(g)\right)$ for $g \in \mathcal{S}(\mathbb{R})$. Thus we can see that Theorem 1.4 holds in the case of $\mathbb{R}^{1}$ by applying the relation $S_{2}(g)=g_{\psi}\left(H_{0}(g)\right)$ and Theorem 5.4 if we argue similarly to the proof of Theorem 1.4 for $n \geq 3$.

Also, by Theorem B we have the following.
Theorem 5.5. Let $\psi$ be as in (5.5). Suppose the condition (1.11) holds. Then

$$
\|f\|_{p, w} \simeq\left\|\Delta_{\psi}(f)\right\|_{p, w}, \quad f \in L_{w}^{p}(\mathbb{R})
$$

By Lemma 5.3 we have $V_{2}(g)=\Delta_{\psi}\left(H_{0}(g)\right), g \in \mathcal{S}(\mathbb{R})$. Applying this and Theorem 5.5 and arguing similarly to the proof of Theorem 1.5 for $n \geq 3$, we can see that Theorem 1.5 holds on $\mathbb{R}^{1}$.

Remark 5.6. When $n=1$, we do not need to assume the conditions (1.2) and (1.3) in Theorems 1.4 and 1.5, respectively, since they follow from the other hypotheses of the theorems, as we have seen above.
